Numerous corporations, ranging from Airbnb to Tesla, and from DraftKings to Uber, have built huge businesses that reside in legal gray areas. Instead of taking the law as a given, these companies have become agents of legal change, focusing major parts of their business plans on changing the law. To achieve their political goals, these companies employ conventional lobbying techniques, but also more innovative tactics. In particular, some attempt to enter markets quickly, then grow too big to ban before regulators can respond. If regulators do take aim at them, they respond by mobilizing their users for political support.

This Article offers the first focused study of what we term regulatory entrepreneurship—entering a line of business in which changing the law is a significant part of the business plan. We provide a framework for understanding this combination of business and political activity and a detailed account of the techniques that these companies employ. Further, the Article identifies and considers the conditions that are most likely to foster regulatory entrepreneurship, the prospects for regulatory entrepreneurship going forward, and its likely positive and negative implications for lawmaking.
INTRODUCTION

A number of high-profile companies have devoted enormous amounts of time and money to entering lines of business that are legally fraught; the applicable laws are unclear, unfavorable, or both. These companies’ fortunes—whether they will be bankrupt or worth billions—often depend not only on the whims of the markets, but also on the resolution of legal issues concerning a core aspect of their business. These companies understand this, and each makes changing the law a material part of its business plan. We call this activity “regulatory entrepreneurship,” and refer to the companies that engage in it as regulatory entrepreneurs.

As regulatory entrepreneurship has become more prominent in recent years, two major developments have come to the fore. First, regulatory entrepreneurs have experienced surprising political successes, securing significant policy victories over some of the country’s most entrenched industry groups. Second, regulatory entrepreneurship has made huge inroads into startup culture. While startups largely used to eschew the political arena, many of the last decade’s most successful startup companies are regulatory entrepreneurs.

Perhaps the country’s most famous regulatory entrepreneur, and an example that we will return to throughout this Article, is Uber. Uber’s business is

built around its popular smartphone app. The app connects people who want rides with drivers in the vicinity who are willing to provide them. Fares are determined based on an algorithm that takes into account factors related to supply and demand, and Uber takes a percentage of each fare. Uber is essentially running a taxi dispatch service for the smartphone age.

However, in most cities, the taxi cab industry is heavily regulated. Rules vary across jurisdictions, but they frequently require cabs to have a special government-issued license or medallion; these licenses are typically in very limited supply. Fares are often based on rigid prescribed formulas. Ten years ago, many observers would have said that the legality of Uber’s business was questionable at best. Uber was undeterred by these legal issues. It has aggressively taken on taxi regulations (and regulators) and worked to change the laws that govern taxi services. In a very concrete sense, Uber and many other recent startups are built around and based upon a plan to change the law—and, in some instances, to simply break the law in the meantime. For Uber—and many other companies like it—political activity has become a critical part of business strategy.

To be sure, corporate political activity is not a new phenomenon. Such activity has been the subject of federal regulation since 1907, and has long been the subject of public controversy. But for much of U.S. history, large,

3 Uber, https://www.uber.com (last visited Feb. 11, 2016) (explaining that a user can use their phone to “Tap the app, get a ride.”).
6 See, e.g., id. at 78 (explaining that “[t]ypically, taxis are regulated at the local level, with city or county boards restricting the number of firms and number of taxis (with the issuance of medallions)” and that municipalities like New York City have strictly limited medallions, causing the price “to reach exorbitant levels”); Josh Barro, Under Pressure From Uber, Taxi Medallion Prices Are Plummeting, N.Y. TIMES (Nov. 27, 2014), http://www.nytimes.com/2014/11/28/upshot/under-pressure-from-uber-taxi-medallion-prices-are-plummeting.html (explaining the medallion system and market).
7 Barro, supra note 6.
8 See supra Part II.A.
10 See Winkler, supra note 9, at 873-74 (arguing that early state and federal regulation of corporate political spending was motivated by concern about the corrupt nature of corporate managers misusing “other people’s money” as well as “fears about excessive corporate power”); see also LEE DRUTMAN, THE BUSINESS OF AMERICA IS LOBBYING: HOW CORPORATIONS BECAME POLITICIZED AND POLITICS BECAME MORE CORPORATE 47-71 (2015).
established companies dominated corporate political activity, often through trade associations. And, while corporate lobbying has grown increasingly proactive over time, it has been rare for a company to adopt a business model that explicitly focuses on seeking a change in the law. Companies have instead prioritized lobbying to protect their existing, legal businesses from cost-increasing regulations and to insulate themselves from competition. For example, U.S. auto manufacturers have long lobbied against increased fuel efficiency and emissions requirements that would make cars more expensive to produce—but these companies were not founded on a plan to roll back already-existing laws that made automobile production unprofitable or outright illegal.

Moreover, the tactics that modern regulatory entrepreneurs are using differ from those that companies have historically relied upon to achieve their political goals. The conventional story of corporate political power relies on gaining quiet access to officials, then leveraging that access to exert influence behind the scenes. While regulatory entrepreneurs have used these tried-and-true methods, they have become better known, and arguably experienced greater success, from the opposite strategy: They make an issue as publicly salient as possible, rally the public to their cause, then use their popular support as a cudgel to beat the change they want from resistant officials.

For example, consider Uber’s experience in New York City, the nation’s largest market for taxi services and among the most tightly regulated. When faced with resistance by New York Mayor Bill de Blasio, Uber’s user base was its biggest weapon. Uber offered free rides to passengers willing to attend a protest at City Hall on its behalf. It used its app to contact drivers and passengers and mobilize them to express their opposition to Mayor de Blasio’s proposal, flooding

---

13 See Drutman, supra note 11 (noting that when corporate political activity began to increase in the 1970s, leading corporations hired lobbyists and “[t]hey killed a major labor law reform, rolled back regulation, lowered their taxes, and helped to move public opinion in favor of less government intervention in the economy.”).

17 Giulia Olsson, *Uber Protests Loudly Outside City Hall*, N.Y. OBSERVER (June 30, 2015, 4:50 PM), http://observer.com/2015/06/uber-protests-loudly-outside-city-hall/. Uber also offered free t-shirts and sandwiches to passersby if they agreed to join the protest. Id.
city hall with over 20,000 e-mails in five days. Uber also added a notable feature to its app: a “de Blasio” button that purported to show how users’ experience would change if mayor de Blasio implemented his proposed policy. Users who pushed the button found that the app consistently predicted a twenty-five minute wait for a pick-up; they were then directed to a petition they could sign declaring their opposition to the mayor’s proposed rule.

Uber won its showdown in New York, at least for the time being. It has won many other fights in other jurisdictions across the country and around the world using a similar playbook. Though it has lost its share of battles, Uber’s overall success in taking on taxi regulations has enabled it to grow into the world’s most valuable private start-up corporation, with an estimated value of more than $60 billion.

And while Uber is the country’s highest-profile regulatory entrepreneur, there are numerous others as well. For example, consider Airbnb, the country’s second-most-valuable private start-up. Its business is connecting property...
owners and renters with travelers in need of short-term lodging. This model has required Airbnb to contend with the many jurisdictions that limit short-term rentals to hotels and similar enterprises; Airbnb has changed these laws in many cities, including its hometown of San Francisco. The movement for marijuana legalization provides another example of regulatory entrepreneurship: ResponsibleOhio recently spent over $20 million pushing a marijuana legalization initiative that would have given its backers the exclusive legal right to grow recreational marijuana in the state. Another regulatory entrepreneur, electric car manufacturer Tesla Motors, believes that it must sell its electric cars directly to consumers in order to fully succeed. This has required Tesla to battle state laws that require car manufacturers to sell through franchised dealerships, and it has already achieved significant victories in several states.

http://www.wired.com/2015/12/airbnb-confirms-1-5-billion-funding-round-now-valued-at-25-5-billion/

33 There is some reason to think that traditional car dealerships have poor incentives to promote electric cars. Electric cars require salespeople to invest time and energy to learn about them, and it currently takes a salesperson more time to complete the sale of an electric car than a gasoline-powered one. Service centers are a major part of modern dealerships, and electric cars such as Tesla’s do not require dealer servicing in the way that gasoline-powered cars do. Many dealerships that sell electric and gas-powered cars discourage customers from buying the former and encourage them to buy the latter. See, e.g., Consumer Reports, Dealers Not Always Plugged In About Electric Cars, CONSUMER REPORTS’ Study Reveals, CONSUMER REPORTS (Apr. 22, 2014, 8:00 AM), http://www.consumerreports.org/cro/news/2014/04/dealers-not-always-plugged-in-about-electric-cars-secret-shopper-study-reveals/index.htm; Cliff Weathers, How Tesla and New Car Technologies Could Make Auto Dealers Obsolete, SALON (Oct. 11, 2014, 5:00 AM), http://www.salon.com/2014/10/11/how_tesla_and_new_car_technologies_could_make_auto_dealers_obsolete_partner/.

While regulatory entrepreneurship has enormous implications for the law, it has received scant scholarly attention. This Article fills this gap in the literature, making four original contributions.

First, in Part I, we define regulatory entrepreneurship and place it into context. We discuss how regulatory entrepreneurship differs from other forms of corporate political activity, and why regulatory entrepreneurship is a politically and economically significant phenomenon.

Second, in Part II, we examine the techniques that regulatory entrepreneurs employ in their efforts to change the law. We identify three creative techniques that modern regulatory entrepreneurs have adopted: They break the law and take advantage of legal gray areas, real or imagined, asking forgiveness instead of permission. They seek to grow “too big to ban” before regulators can act, sometimes referred to as “guerilla growth.” Perhaps most dramatic, they mobilize their users and stakeholders as a political force. We illustrate each of these techniques with multiple real-world examples.

Third, we build on this analysis to determine the conditions that are most likely to foster regulatory entrepreneurship. In Part III, we identify and consider three variables that are of particular importance: the nature of the business, the nature of the laws creating uncertainty, and the company’s stage and status.

Fourth, we explore the future of regulatory entrepreneurship. We begin Part IV by analyzing the prospects for regulatory entrepreneurship going forward. There are some reasons to think that the best opportunities for regulatory entrepreneurship are already being exploited. However, the market has become increasingly comfortable with regulatory entrepreneurship as a business strategy, and the infrastructure that has been assembled to date will facilitate new attempts at regulatory entrepreneurship on an ongoing basis. Perhaps most importantly, information technology continues to advance at an exponential pace. This will lower the cost of political engagement and make it easier for citizens to express their preferences, simultaneously creating new opportunities for companies to mobilize large groups of people on their behalf. Accordingly, we conclude that regulatory entrepreneurship is likely to increase in the years to come.

We also consider how regulatory entrepreneurship will affect the mix of laws and regulations that society ultimately enacts. One intriguing aspect of regulatory entrepreneurship is its potential to combat socially inefficient laws. For example, the political economy literature has long observed that some laws and regulations provide concentrated benefits to particular interest groups, while imposing diffuse costs on the public.36 In these circumstances, the members of

---

36 Public choice theory elucidates how citizens can rationally decide not to participate in the political process because the costs outweigh the benefits to individual actors. See, e.g., Michael E. Levine & Jennifer L. Forrence, Regulatory Capture, Public Interest and the Public Agenda: Toward a Synthesis, 6 J.L. ECON. & ORG. 167, 189 (1990). Further, because of the rational apathy
the relevant interest group have a strong incentive to advocate for the law in question. However, because the law’s costs are spread over a much larger group, those who would be hurt by the law have little incentive to actively resist it. This can result in laws being enacted whose costs exceed their benefits. Regulatory entrepreneurs can be a force against such inefficient laws because they can lower the cost of civic engagement for their users—the public—and create a dynamic in which a new actor is willing to actively push for change.

Yet we do not wish to paint regulatory entrepreneurship as a panacea, or even an unmitigated good. Regulatory entrepreneurs are profit-seeking entities, not saints, and they will generally use their political power to pursue the results that are best for themselves, not the results that are best for society. Accordingly, regulatory entrepreneurship is unlikely to fully solve any of the pathologies of the political system. Moreover, in some instances, regulatory entrepreneurship may have significant negative effects on society. Overall, the likely effect of regulatory entrepreneurship is to make the government more responsive to business interests in general and certain types of companies in particular. Whether one considers this a positive or negative development will depend on one’s view of those interests.

I. A Theory of Regulatory Entrepreneurship

All businesses face legal issues as part of their business operations. And companies naturally would like the laws that apply to them to be favorable.

But some companies enter a line of business that has a legal issue at its core—a significant uncertainty regarding how the law will apply to a main part of the business operations, a need for new regulations in order for products to be feasible or profitable, or a legal restriction that prevents the long-term operation of the business. Some companies enter this legally fraught business with the plan of eliminating these legal risks and issues by changing the law. For these entrepreneurs, political activity is generally a major component of their business models. Essentially, these companies are in the business of trying to change the
law. We term such businesses “regulatory entrepreneurs,” and this class of business activity “regulatory entrepreneurship.” Regulatory entrepreneurship is not a new phenomenon, but a spate of recent startup and technology companies have made it an increasingly salient one.

Of course, businesses have long engaged in political activity; corporations have been involved in U.S. politics since at least the 1800s. U.S. corporations and their trade associations spend billions of dollars each year on lobbying efforts. Nonetheless, regulatory entrepreneurship differs from long-established forms of corporate political activity in several significant ways.

Historically, corporate lobbying has been primarily a reactive endeavor. Companies have long lobbied to insulate themselves against competition. The growth of the regulatory state, and the increasing involvement of the government in the economic sphere, spawned a responsive increase in corporate politicking as companies fought to resist cost-increasing regulations—and, if possible, to capture the regulators and use them as another tool to insulate themselves against competition.

But by and large, corporate political activities have been, and continue to be, conducted by established businesses focused on protecting existing profit centers. It has been rare for a company to enter a line of business with the plan of changing the law. When companies have attempted to change the law, it has often been around the edges of existing businesses, shifting the boundaries to give a legal, profitable business more room to grow. For example, U.S. banks used to be limited to particular geographic areas; there were many legal hurdles to

---

39 We note that regulatory entrepreneurship is distinct from regulatory arbitrage. Regulatory arbitrage arises when parties change the form of their transaction, but not its substance, in order to effect more favorable regulatory treatment. See Victor Fleischer, Regulatory Arbitrage, 89 Tex. L. Rev. 227, 229-30 (2010) (defining regulatory arbitrage as “the manipulation of the structure of a deal to take advantage of a gap between the economic substance of a transaction and its regulatory treatment”); see also Jordan M. Barry, On Regulatory Arbitrage, 89 Tex. L. Rev. See Also 69, 73 (2011) (“[R]egulatory arbitrage is a phenomenon that follows from having regulations that fail to take economic reality into account.”); Frank Partnoy, Financial Derivatives and the Costs of Regulatory Arbitrage, 22 J. Corp. L. 211, 227 (“Regulatory arbitrage consists of those financial transactions designed specifically to reduce costs or capture profit opportunities created by differential regulation or laws.”). Regulatory entrepreneurship, in contrast, is about entrepreneurial activity that takes on significant legal uncertainty.

40 Mark A. Smith, American Business and Political Power: Public Opinion, Elections and Democracy 6 (2000); Winkler, supra note 9, at 881.

41 See, e.g., Drutman, supra note 10, at 8 (“A total of 3,587 individual corporations reported a combined $1.84 billion in lobbying expenditures, roughly 56 percent of all the disclosed money spent on lobbying in 2012. Add in another $553 million in spending by trade associations and $175 million in spending by business-wide associations, and that’s $2.57 billion in combined spending—78 percent of all the money spent on lobbying in 2012.”).

42 See Drutman, supra note 10, at 3 (noting that corporate lobbying was historically “sparse and mostly defensive”).

43 See id. at 55 (describing “the political awakening of corporate lobbying” that begin in the 1970s after a period of new major regulatory laws).
opening branches nationwide. Profitable banks kept pushing at these restrictions as they sought to expand their business, and the effect was a gradual weakening of the law’s restrictions over time and a commensurate growth in banks’ geographic scope. Legal change was valuable and helped fuel growth, but it was not a core part of the original business plan when the banks entered the business.

For regulatory entrepreneurs, this is not the case. They enter lines of business knowing that changing the legal environment is important for the business’s growth, or even its legality, and with the intention of effecting that change. Changing the law is not a side project, it is an integral part of the business plan.

Further, we believe that regulatory entrepreneurship has already proven to be a politically and economically significant phenomenon. Many regulatory entrepreneurs have scored significant political victories against some of the country’s most entrenched interest groups. Regulatory entrepreneurs have produced legal changes that seemed quite unlikely a decade or two ago, including some victories that long eluded established, politically connected firms.

For example, many states prohibit vehicle manufacturers from selling directly to customers (“direct distribution”); instead, manufacturers must sell their cars through independent dealers. States enacted these laws to protect car dealers; in addition to imposing dealers as mandatory middlemen, they also make it difficult for manufacturers to terminate a dealership, even in the event of poor service or salesmanship. These laws have been in place for over fifty years, despite multiple attempts by the major car companies to pare them back.

Electric car manufacturer Tesla Motors was founded in 2003 with the goal of proving that electric cars could be better than gasoline-powered cars. Because of the differences between gasoline-powered cars and Tesla’s electric cars, especially with respect to the way that they are serviced, Tesla concluded that car dealers would not have good incentives to promote their cars.

45 Id. at 51-63.
47 Musk, supra note 46.
48 See Death of a Car Salesman, supra note 46; Crane, supra note 34, at 12.
Accordingly, from the beginning, Tesla’s founders determined that direct distribution was critical to the success of its business model.\textsuperscript{51} Yet direct distribution was prohibited in many states. This means that Tesla started its business with the understanding that a change in the law was vital to the company’s success. Given the political realities surrounding dealer franchise laws, Tesla knew that it had to create its own lobbying efforts to battle the car dealers’ lobby for state legislative reforms.\textsuperscript{52} Car dealers have successfully blocked Tesla in several states, but the company has fought back and is slowly winning most of its fights.\textsuperscript{53} Thus, Tesla has made far greater inroads against the car dealership laws than more established car manufacturers have, despite these companies’ far greater size, value,\textsuperscript{54} longevity, and perceived political power.\textsuperscript{55}

Three more points merit emphasis here. First, we define regulatory entrepreneurship as a phenomenon that applies with respect to a line of business. For example, Google (now Alphabet) runs its well-known, clearly legal, and highly profitable search engine business. It is also pouring large amounts of resources into developing self-driving cars. Assuming that Google successfully develops the necessary technology to support this business, it will still not be viable or financially successful in the long term unless states change their laws in order to permit self-driving cars to use public roads.\textsuperscript{56} Google was well aware of

\textsuperscript{51} Tesla’s registration statement in its initial public offering acknowledged: “Implementing our business model is subject to numerous significant challenges, including obtaining permits and approvals from local and state authorities, and we may not be successful in addressing these challenges. . . . [W]e will need to persuade customers, suppliers and regulators of the validity and sustainability of our business model.” Tesla Motors, Inc., Amendment No. 1 to Form S-1 Registration Statement, Jun. 2, 2011, at 22-23, available at http://ir.teslamotors.com/sec.cfm?view=all. See also Tesla Motors, https://www.teslamotors.com/about (last visited Jan. 16, 2016); Crane, supra note 34, at 1.

\textsuperscript{52} Crane, supra note 34, at 1; Catherine Ho, PowerMoves, WASH. POST (Nov. 18, 2015), https://www.washingtonpost.com/news/powerpost/wp/2015/11/18/powersmoves-scrambling-toshape-refugee-policy-after-paris/ (noting that Tesla Motors hired lobbyist to lobby on automotive industry issues).

\textsuperscript{56} See Claire Cain Miller, When Driverless Cars Break the Law, N.Y. TIMES (May 13, 2014), http://www.nytimes.com/2014/05/14/upshot/when-driverless-cars-break-the-law.html (“Only four states and the District of Columbia have passed laws specific to driverless cars, some just allowing manufacturers to test cars and none answering every legal question that might come up.”); Salvador Rodriguez, California, Google Ready For Autonomous Vehicle Showdown in 2016, I.B. TIMES (Feb. 15, 2:20 AM), http://www.ibtimes.com/california-google-ready-autonomous-vehicle-showdown-2016-2233290 (“California’s lead in the race to autonomous, self-driving vehicles
this, and entered the self-driving car business intending to convince states to open their roads to its cars. By doing so, Google is engaging in regulatory entrepreneurship, even if Google’s other lines of business and the continued viability of Google as a company overall do not depend on a change in the law.

Second, because regulatory entrepreneurship is primarily a profit-driven activity, it does not depend on legal formalities. Regulatory entrepreneurs do not necessarily care whether they effect a legal change on a de facto or de jure basis. For example, if the relevant regulatory body credibly commits to not enforcing the law on the books, that is functionally just as good, from the entrepreneur’s perspective, as amending the law.

Third, distinguishing regulatory entrepreneurs from other entrepreneurs is admittedly a matter of degree; at what point does changing the law become “important enough” to the company’s business plan that the company becomes a regulatory entrepreneur? Nonetheless, it is useful to recognize that, for some businesses, changing the law is a material part of the business plan, and to examine the implications that follow from this phenomenon.

II. HOW REGULATORY ENTREPRENEURS INSTIGATE LEGAL CHANGE

In this Part, we explore how the most effective regulatory entrepreneurs weave together both time-tested and innovative new tactics to create a larger strategy for changing the law.

A. Breaking the Law or Taking Advantage of Legal Gray Areas

Many regulatory entrepreneurs follow the maxim that it is better to beg forgiveness than to ask for permission. In this context, that translates to “it is better to enter markets and start providing services to the public—legally or otherwise—than to seek approval from regulators.” Companies often justify this behavior by construing some gray area in the law as permitting the action in question. It helps that regulatory entrepreneurs often have new business models, frequently built on new technology: Because law often lags technology, companies may plausibly be able to claim that existing laws do not clearly address their precise circumstances.

A motivated entrepreneur can often manufacture a legal gray area, blurring the line between outright lawbreaking and aggressive interpretation. Even if existing regulations or statutes use broad language that would, when read literally, prohibit the company’s business model, companies can take the view that officials were not considering the company’s business model when the laws were written—how could they, when the model did not yet exist? Thus, they can

---

could come to a grinding halt should the state adopt draft measures announced this week that would all but make Google’s driverless vehicles illegal.”).
assert that the laws were not meant to cover their new circumstances, and that courts will construe them accordingly.

It is difficult to know from an outside perspective whether particular companies are deliberately violating laws, and in many instances there is at least room for argument about the matter. For our purposes, it suffices (and we believe it is fair) to say that when regulatory entrepreneurs move into a market, they often take an aggressively favorable reading of the relevant law, and that the correctness of their interpretation—that is, whether or not they are actually complying with the law initially—is not a first-order concern.57

This state of affairs—operating and growing their business, while taking the questionable position that they are acting within the bounds of the law—generally benefits regulatory entrepreneurs. They typically opt to continue it as long as possible, which means at least until regulators and enforcement agencies come knocking. Thus, in sum, many regulatory entrepreneurs’ approach includes strategically operating in a zone of questionable legality or breaking the law until they can (hopefully) change it.

For example, early in Uber’s operations, the company was reported to have received and ignored a cease-and-desist demand from transit regulators in its first city, San Francisco.58 The company has followed the same playbook in other cities when problems have arisen, even internationally. Uber and its executives have been embroiled in legal battles in Paris, for instance, after refusing to shut down its “UberPop” service following the passage of a transportation law that made it illegal.59 Despite police crackdowns, Uber has repeatedly paid drivers’ fines and continued to advertise on radio stations.60

Uber’s main competitor, Lyft, has taken a similar approach. In a court filing, the New York state attorney general’s office claimed:

---

57 The many public reports of startup companies ignoring notifications of their illegal activity suggests that this is part of a larger strategy combining business and politics. See, e.g., Serena Saitto, Inside Big Taxi’s Dirty War with Uber, BLOOMBERG BUSINESS (Mar. 11, 2015, 5:00 AM), http://www.bloomberg.com/news/articles/2015-03-11/inside-big-taxi-s-dirty-war-with-uber (“Uber’s strategy has been to launch services regardless of the rules and then leverage its popularity to force regulators to adapt. So far, that approach has succeeded in about 30 markets in North America, . . . where new laws on licensing and safety have been created for so-called transportation network companies like Uber are in the process of being approved.”).

60 Alderman, supra note 59 (quoting the general manager of Uber France: “We tell [drivers], if you get fined, come to us and we’ll support you. We want them to feel as confident as we feel about what we’re doing and our interpretation of the law.”).
As it has done in every other city in which it operates, defendant has simply waltzed into New York and set up shop while defying every law passed whose very purpose is to protect the People of the State of New York. Despite being warned and told to cease and desist by three separate regulatory and enforcement agencies, defendant has thumbed its nose at the law and continued with its plan to launch in what could become its largest market.61

As another example, technology investors have placed bets in the mobile payments and virtual currencies space, an area of innovation that raises significant legal questions. Marc Andreessen, the principal of a leading venture capital (VC) firm, recounted the advice that one of his lawyers had given on the topic of the virtual currency bitcoin62: “Good news guys. Here you have a financial instrument that can be simultaneously regulated as a currency, a commodity, and a security. . . Regulators will fight over who, exactly, gets to regulate it, and VC’s job is to sneak through the fight.”63

Yishan Wong, a Silicon Valley angel investor who was an early PayPal employee and formerly the CEO of Reddit, explained a similar view:

[I]f you are a startup who feels that the violation of a law (or an excursion into a grey and questionable/undefined area of the law) will allow you to create a business that provides enormous value to people, the tactically wise thing to do is to move forward and try to build the business. Moreover, if your business is not doing something morally egregious (e.g. killing people) but simply violating the law in a somewhat more minor way, the officers of the company bear little more risk than the company being sued out

---

62 Kevin V. Tu & Michael W. Meredith, Rethinking Virtual Currency Regulation in the Bitcoin Age, 90 WASH. L. REV. 271, 277 (2015) (“As a type of virtual currency, Bitcoin is a medium of exchange that (1) is electronically created and stored, and (2) lacks the backing of a government authority, central bank, or a commodity like gold. Like traditional currency, virtual currencies such as Bitcoin can be used to purchase goods and services from any person that is willing to accept it as a form of payment.”).

of existence, i.e. they bear little personal risk besides opportunity cost.\textsuperscript{64}

He further explained that “[t]he law and its subsequent enforcement are often defined by the will of the people.”\textsuperscript{65} Moreover, “if there is a business that a lot of people like but is in gross violation of the law, it is typically allowed to stand, either via a subsequent modification of the law, clarifications in the grey area which end up being favorable to the business, or lax enforcement.”\textsuperscript{66}

\textbf{B. Growing Too Big to Ban}

Timing plays an important role in a strategy to break the law or operate in a gray area of the law: Early movers may establish a market position that will in turn affect their leverage vis-à-vis the government and the ultimate success of their business model. To again quote Mr. Yishan Wong:

In the case of Airbnb, the likely time it will take for entrenched business interests to react to Airbnb, for a debate about enforcement and clarification of the law, and then for regulations to be proposed, debated, amended, passed, and then enforcement measures taken is likely to be more time than it will take for Airbnb—moving at internet speed—to establish itself as a globally viable business. By the time that happens, the market (i.e. the democratic majority) will probably have shifted to favor its interests, so long as they continue to operate the business in a way that benefits travelers and would-be amateur hoteliers.\textsuperscript{67}

Other commentators have aptly described this approach as “guerrilla growth” or aiming to grow “too big to ban.”\textsuperscript{68} Growth is important for almost any business, but it is particularly so for a regulatory entrepreneur. Some regulatory entrepreneurs pursue rapid growth not just to improve their valuation or prospects for profits, but also to gain political advantage against regulators that might seek to ban or regulate the business activity. Business growth can translate to consumer popularity that becomes difficult for regulators to ignore.

\textsuperscript{64} Yishan Wong’s answer to “Airbnb: Why has Airbnb not been sued or regulated out of existence?”, https://www.quora.com/Airbnb/Why-has-Airbnb-not-been-sued-or-regulated-out-of-existence.

\textsuperscript{66} Id.
\textsuperscript{67} Id.
Uber again illustrates this point clearly. Uber makes its money by taking a percentage of the driver’s fare. On numerous occasions, Uber has dramatically cut its prices in order to increase its user base, valuing growth over profitability. At times, Uber has cut its prices to such a great extent that it effectively paid customers to use its service.

Loss leaders are well-known in business, but it is rare for a company’s main product to be one. Ordinarily, this would evoke the old business joke about losing money on every sale, but making it up in volume. But for Uber, this was considered a savvy strategy because “[i]f Uber gets big enough quickly enough, the political price could become too high for any elected official who tries to pull Uber to the curb.” Another commentator remarked: “[I]t has already outgrown the stage at which its growth could have been squelched by aggressive regulatory action, à la the Internet-TV startup Aereo. At this point, any regulatory crackdowns will only serve to define the contours of Uber’s dominance.” Politicians have taken notice of the political dimension to this growth. A California State Assembly member who sponsored a measure to regulate Uber remarked: “They wanted to get themselves established very quickly as the bully you didn’t want to mess with.”

Another recent example of companies taking the too-big-to-ban strategy includes fantasy sports gaming sites FanDuel and DraftKings. These companies charge a fee for users to play online auction-based fantasy games; the companies keep a percentage of the fees and pay out the rest as prizes. Both FanDuel and DraftKings have prioritized growth over profits; they return large percentages of

their revenues back to users in the form of prize money and spend millions on advertising during sports broadcasts. These firms are credited with creating a new industry in fantasy sports that barely existed just a couple of years ago, but that is now projected to produce $31 billion in player entry fees and $2.6 billion in net revenue by 2020.

After a recent determination by New York’s attorney general that the gaming sites are breaking the law, FanDuel and DraftKings both released statements invoking their size and popularity and questioning the state’s attempt to shut them down. FanDuel’s statement read, in part: “This is a politician telling hundreds of thousands of New Yorkers they are not allowed to play a game they love and share with friends, family, coworkers and players across the country.” DraftKings similarly stated: “We strongly disagree with the reasoning in [the] opinion and will examine and vigorously pursue all legal options available to ensure our over half a million customers in New York State can continue to play the fantasy sports games they love.”

C. Mobilizing Users and Other Stakeholders for Political Power

An especially interesting strategy in the regulatory entrepreneurship toolbox has been to use customers and other stakeholders to fight corporate political battles. Not all companies are well-loved enough by the public for this to be viable, but for those with the support of their users and stakeholders it has proven a particularly effective tactic.

For example, Virginia’s Department of Motor Vehicles sent Uber a cease-and-desist order notifying the company that its service was illegal and that it needed to immediately cease all operations in the state. Uber responded by sending a notice to all of its Virginia users, along with the contact information for the ordinarily low-profile state official involved in the decision. Within a few days, hundreds of angry Uber customers had emailed the official, inundating his inbox and requiring him to work all weekend to respond. Uber also hired a team of lobbyists in Virginia and, within 48 hours, the state’s transportation secretary instructed the DMV not to interfere with Uber drivers. Uber lobbyists then submitted a proposed temporary operating permit, which state officials granted several weeks later, permitting the company (as well as Uber competitor Lyft), to continue their normal operations.

83 Id.
84 Id.
85 Id.
Uber has repeatedly used this tactic of sending alerts to riders on their phones, asking them to sign petitions or contact public officials at key political moments for the company. Its users often respond quickly and in vast numbers—reportedly at a rate of seven electronic signatures per second in some instances. When the Illinois General Assembly passed a restrictive measure that would negatively impact Uber’s business, Uber used its smartphone app to mobilize its army of users. It inserted a splash screen and emailed Illinois riders requesting that they sign a digital petition asking the state governor to veto the bill. Twenty-five thousand supporters signed the petition in its first hour.

In Portland, when faced with a city ordinance that was an obstacle to its black car ride service, Uber announced on its blog that it would run a one-day promotion delivering free ice cream around the city. The ice cream “delivery” event provided the company with a database of people who were likely to be sympathetic to its goals, and who it could then turn into advocates for its ride sharing service. Almost 1,700 people signed a petition to allow the company to operate in the city. When Uber later launched its UberX service in the city before the service had been officially sanctioned, the company carefully used hyper-local marketing to appeal to Portland residents, such as creating an ad with a well-known quirky unicyclist bagpiper as the first rider. The company then threw itself a party at which attendees could take photos with protest signs or send a postcard to the mayor. In the first four hours, more than 7,000 people signed a petition in support of Uber operating its service in Portland. Uber’s key political strategist, David Plouffe, has drawn a parallel between customers and campaign volunteers.

Airbnb has also leveraged its users for political advantage. The company recently announced plans to create and support “clubs” in 100 U.S. cities to help residents campaign against local rules restricting short-term rentals. Airbnb expects hosts and guests who use their service to run the clubs, which have been...
likened to local unions. The company’s global policy chief stated, “We’ll spend what it takes to succeed.”

This strategy comes on the heels of Airbnb’s $8.4 million ground campaign in San Francisco, in which the company mobilized hosts and guests to defeat a local proposition that would have limited short-term rentals. Over 2,000 volunteers knocked on over 285,000 doors in the city in order to gain political support for Airbnb’s cause. Until recently, such mobilized grassroots support for a multibillion-dollar company has been unheard of, or is at least highly unusual.

And, indeed, this kind of regulatory entrepreneurship raises the question of whether such political support can be called grassroots when it has been catalyzed from the top-down as part of a corporate strategy. It was Airbnb’s own global policy chief, previously a D.C. political operative, who framed the business as a “movement” at a San Francisco news conference: “There is going to be more people doing home-sharing tomorrow than there are today, there is going to be more the day after that. This is now a movement.”

Similarly, when fantasy gaming sites FanDuel and DraftKings found themselves in the political spotlight, they catalyzed fans and informed them of their efforts and what the fans could do to help. Efforts included writing a charter for a new fantasy sports trade association, asking a former federal judge and attorney general to review the company’s practices, forming an advisory board led by a former United States Attorney General for the Southern District of New York, and proactively trying to work with state legislators to adopt consumer protection requirements such as age verification that would allow the companies to continue to operate and grow. FanDuel’s CEO further noted that in just two weeks’ time the company had secured more than 145,000 signatures on its petition “seeking to protect your right to play fantasy sports” and provided a link to sign the petition.

D. More Traditional Political Techniques

Finally, regulatory entrepreneurs have also taken advantage of the full range of traditional lobbying techniques that established firms have typically employed. This includes tactics such as putting political operatives on the board of directors or hiring them as key advisers and using professional lobbyists.

Placing political operatives on the board of directors of a company, particularly an early-stage startup company, indicates that regulatory affairs is likely crucial to the business and that changing existing laws or making new laws may be key to the business model. Take, for example, Hyperloop Technologies, a regulatory entrepreneur startup inspired by billionaire technology mogul Elon Musk’s idea of a futuristic vacuum-tube transport network that could transport passengers and freight at over 700 miles an hour.107 The company was started with the understanding that it would have to change the law or create new law to support their nascent, never-done-before technology—persuading governments to support futuristic infrastructure, obtaining rights-of-way through cities and across vast distances, and navigating transportation laws written for a different era. The technical challenges involved in developing a hyperloop transportation network are enormous, but the political challenges are equally monumental.

Hyperloop has prepared for political and legal battles by getting influential political operatives involved before those battles have even begun. When the Chief Technology Officer of Hyperloop Technologies first met the company co-founder, he said “I can build the technology—you’ve got to get me the right of way to do it.”108 The co-founder replied, “We’ve got Jim Messina on our board,” referring to the campaign manager for President Obama’s 2012 reelection and former White House deputy chief of staff.109 In its early stages, the company had also met with major politicians, such as U.S. Senate Democratic leader Harry Reid.110 President Obama himself had been briefed on the early-stage startup company and its vision for ultra-high-speed transportation.111 The company has also developed a relationship with Eric Garcetti, the mayor of Los Angeles, where the startup is based, who has joked: “I’ve been part of the marketing department. I talk about it all the time. I’ve talked to [U.S. Secretary of Transportation Anthony Foxx], the vice president, the president—and they’re not paying me a thing!”112 Many other companies have adopted similar strategies.113

108 Id.
109 Id. Jim Messina has also worked for Uber and Airbnb. Id.
110 Id.
111 Id.
Hiring professional lobbyists is another technique that regulatory entrepreneurs use. For example, consider once more electric car manufacturer Tesla Motors. To succeed in its fight against dealer franchise laws, Tesla has had to battle the car dealers lobby and create its own lobbying efforts for state legislative reforms.114 The lobbyists that Tesla has hired have been key to its efforts to help win over state legislators. In Texas, for example, Tesla has spent over half a million dollars on lobbyists in each of the past couple of years.115 Tesla hired several notable local lobbyists, including Mike Toomey, a trusted advisor to Governor Rick Perry; Karen Steakley, an ex-deputy legislative director for Governor Rick Perry; Craig Chick, a former senior policy adviser for notable Texas legislators; and Adam Goldman, whose brother is a state lawmaker.116 The company started building a coalition of lawmakers and business groups supportive of their cause and hosting legislative staffers at policy forums and company receptions.117 These traditional political lobbying techniques have been aimed at helping the company to level the playing field against the powerful car dealer lobby, which has been politically active and generous in making political expenditures for years.118 A Tesla vice president explained: “We understood the political equations. We would be stupid not to prepare and equip ourselves to argue effectively in this Legislature.”119

III. CONDITIONS THAT FOSTER REGULATORY ENTREPRENEURSHIP

In this Part, we use the insights from our analysis in Part II to identify and consider three basic groups of factors that are particularly important to fostering

113 Other notable examples of companies involving political strategists in key business positions include Uber (David Plouffe), Airbnb (Chris Lehane), and Theranos (Henry Kissinger; George Shultz; Sam Nunn; Bill Frist). Helderman, supra note 76; Dougherty & Isaac, supra note 98; Jennifer Reingold, Theranos’ Board: Plenty of Political Connections, Little Relevant Expertise, FORTUNE (Oct. 15, 2015, 12:49 PM), http://fortune.com/2015/10/15/theranos-board-leadership/. Regulatory entrepreneurs have also engaged consultants who come through the “revolving door.” For example, William Haraf, who had been the Commissioner of the California Department of Financial Institutions, and on whose watch California’s money transmission law was implemented, became Managing Director of Promontory Financial Group, a consultancy which advises startups in the virtual currency space. See Greenspan testimony, supra note 63.

119 Id.
or discouraging regulatory entrepreneurship. First, we explore factors related to the line of business in question. Second, we consider law-based factors related to the nature of the regulatory uncertainty that the entrepreneur faces. Third, we compare the relative advantages of startup corporations versus more established businesses.

A. Business-Related Factors

Some lines of business are better suited to a regulatory entrepreneurship model than others. As discussed in Part II, the strategies that modern regulatory entrepreneurs employ to effect legal change require two chief inputs: The traditional methods that corporations have used to exert influence—hiring lobbyists, putting politically connected people on their boards, revolving door hiring practices, and spending money on political advertisements—primarily require money. But perhaps even more important for the newer techniques that regulatory entrepreneurs have been pioneering is a user base that can be mobilized as a political force.

What, then, characterizes businesses with the “right” kind of user base? Such businesses possess three chief characteristics: scalability, connectedness, and mass appeal.

Scalability refers to the business being able to expand its user base quickly and easily. For businesses to successfully mobilize users against a regulatory crackdown, they must have sufficient users to fight back at an early enough point in time. It helps to grow quickly so that regulators, who often move slower than entrepreneurs, are unable to squelch the business before it reaches a critical mass. Many regulatory entrepreneurs employ a guerrilla growth strategy to achieve exactly this result. The success of such a strategy depends on growing quickly, and this cannot be done if expanding one’s user base requires customized service or extensive and slow capital investment. For example, an advertising agency’s business is not scalable because its service is customized for each client and cannot be standardized. By contrast, a company whose main product is software is easily scalable; the extra cost of adding a new user is negligible.

But while having a large user base is necessary, it is not sufficient. A large user base is of little help if those users are unwilling to act; the company must also be able to mobilize those users. This likely depends on several things. The first is the frequency with which users interact with the company. User interactions are opportunities for the company to inform and activate users; the more interactions, the better the company’s prospects. Next is whether the format through which the company interacts with its users makes it easy for the company to send users information. How much information the company has about its users matters as well; the more that the company knows about its users, the more it can engage them in a targeted manner. For example, legislators are likely to be more responsive to comments received from their own constituents than from
voters they do not represent. If the company knows where its users live, it may be able to direct individual users’ gestures of support (e-mails, phone calls, signed petitions, etc.) to their particular representatives, amplifying their effect. Finally, how motivated will the company’s user base be to act on the company’s behalf? This will depend on not only the frequency with which users interact with the company, but also on the significance of those interactions. To the extent that the company taps into feelings of identity or more significant needs, users are likely to be more willing to engage.

In addition, the composition of the company’s user base matters. Several studies have examined what drives policy changes in the United States, and two findings are key for regulatory entrepreneurship: First, there is a strong status quo bias; it is hard to change the law. Second, the chances of changing the law are greatest when high-earning citizens support the change. Thus, a user base that contains many affluent users is likely to significantly increase a company’s chance of success.

At the same time, however, anecdotal evidence suggests that it is also helpful to have a compelling story to tell. People remember personal stories; putting the right face on an issue is a potent political tool. Thus, it helps to have a product that also benefits middle- or working-class people, whose stories may be more likely to evoke sympathy and support among viewers, as well as the affluent.

For example, in November 2015, San Francisco was considering Proposition F, an initiative that would have increased restrictions on short-term rentals in San Francisco. In the days leading up to the vote, Airbnb and its supporters blanketed the airwaves with advertisements urging voters to oppose the measure. A number of ads opposing Proposition F featured the stories of people who frequently rent out various spaces on a short-term basis. All of

123 Nancy Watzman, Pro-Airbnb Advertising Dominated Recent Political TV Ads in San Francisco, Archive (Nov. 4, 2015), http://webcache.googleusercontent.com/search?q=cache:UALLU18Mk5IJ:https://blog.archive.org/2015/11/04/pro-airbnb-advertising-dominated-recent-political-tv-ads-in-san-francisco/+&cd=4&hl=en&ct=clnk&gl=us (finding that anti-proposition F ads constituted roughly two-thirds of all political TV ads; the ratio of television ad minutes opposing prop F to those supporting it was over 120:1; the ratio of television ad minutes opposing prop F to those related to the mayoral race was more than 35:1).
these people talked about the difficulties of living in such an expensive city, and most told stories about particular financial needs that short-term renting helped them to manage, such as financially supporting elderly parents and paying for a two-year-old daughter’s childcare. One ad featured a couple asserting that home sharing enables them to go volunteer and teach English to Tibetan refugees and impoverished children.

By contrast, supporters of Proposition F made advertisements that suggested a more unflattering view of their opponents, such as “Save the Moguls,” which cast rich commercial landlords as the face of short-term rentals. Another had actors play a variety of unsympathetic figures, each of whom gives her reasons for opposing Proposition F. Many of these reasons are immoral, such as a desire to exclude elderly people from San Francisco and to evict minority tenants. Others are simply politically unpersuasive, such as a character who talked about how short-term rental of his extra room had enabled him to fund his artisanal relish production.

Despite this effort by the proposition’s supporters, Airbnb won its battle against Proposition F, as voters rejected it by a 10-point margin. Other companies have successfully employed similar tactics in their political battles. To take another example, during Uber’s battle for New York, it ran advertisements in which Uber drivers highlighted how becoming an Uber driver had improved their lives. They spoke about how their pre-Uber lives were characterized by difficulties finding jobs, being unable to pay their mortgages, and struggling to make ends meet. One said that becoming an Uber driver “was probably the best thing that’s happened in [his] life.” Another described it as “a blessing . . . We don’t just pick people up. We pick ourselves up. We pick our families up.” It asserted that Uber would create 10,000 jobs in New York City over the next year, and urged voters to tell mayor de Blasio, who had received significant donations from the taxi industry, “Don’t put taxi donors ahead of jobs.”

advertisement closed with an Uber driver saying “millionaire [cab] medallion owners don’t need help. People like us do.”

These business-related factors help explain why regulatory entrepreneurship has increased so much in recent years. Many of the most successful startup companies in the last few years are “platform” companies. These businesses profit by using technology to connect buyers and sellers on a proprietary platform. Examples include Uber, Lyft, Airbnb, and others.

Platform business models are enormously scalable; if new users wish to join the system, they can be added quickly and easily. Moreover, since these businesses are built around the platform, these companies are well-equipped to communicate with their users. Depending on the product and user in question, the user’s level of commitment to the company can be quite large. For example, an Uber driver or an Airbnb landlord—or a provider on a lesser-known platform, such as zTailors, the “Uber for tailors”—may reap hundreds or even thousands of dollars a week via their interaction with the app. In addition, in many instances the regulatory entrepreneur will have a great deal of information about the user, such as where she lives and how much she uses the entrepreneur’s product, that may potentially allow the entrepreneur to leverage that user more effectively.

Finally, the most successful of these businesses appeal to both those with high incomes and those of more modest means. New York Uber users include high earners willing to pay extra to get a ride home immediately at the end of a

Rauch & David Schleicher, Like Uber, But for Local Government Law: The Future of Local Regulation of the Sharing Economy, 76 OHIO ST. L.J. 901 (2015) (discussing various sharing economy peer-to-peer platform companies); Fortune, The Unicorn List, available at http://fortune.com/unicorns/ (last visited Jan. 29, 2016) (listing startup companies valued at $1 billion or more and including platform companies such as Uber, Airbnb, Lyft, BlaBlaCar, FanDuel, and DraftKings).

139 Fortune, The Unicorn List, supra note 138.

rainy night out, middle-class outer borough residents who have trouble finding cabs in their neighborhoods, and Uber drivers who might face serious hardships without the income they earn through Uber.\textsuperscript{142} Airbnb landlords include those who need to rent out rooms to guests in order to cover the cost of their housing, as well as well-off people who buy investment properties and rent them for profit.\textsuperscript{143} These types of broad user bases can maximize a company’s chance of political success.

B. Law-Related Factors

The chance of successfully executing a regulatory entrepreneurship strategy depends on a number of factors related to the law in question. These relate to the kind and magnitude of regulatory uncertainty that the entrepreneur is taking on.

One important factor is the penalty that the law imposes on violators. For example, if the only penalty is a civil fine imposed on the corporation, pushing the boundaries of the law may be an attractive prospect. If the fine is low enough, the business may not even have to worry about changing the law and can simply pay fines as they come up.\textsuperscript{144}

On the other hand, if a law provides for the incarceration of the executives of a company that violates it, that is likely to serve as a serious deterrent to the guerrilla growth strategies that modern regulatory entrepreneurs employ. For instance, in some states, operating an unlicensed money transfer business is a felony punishable by imprisonment and a criminal fine;\textsuperscript{145} this has tamped down on mobile payment companies’ willingness to push the boundaries of the licensing regimes they face.\textsuperscript{146}

Another key element is whether the law in question is determined at the local, state, or national level. Change at the state and local level is often possible more quickly than at the national level. This is largely by design; the framers wanted to ensure that state governments remained important centers of power and served as laboratories of democracy and reform.\textsuperscript{147} The faster pace at which

\begin{footnotesize}
\textsuperscript{142} See Carolyn Said, \textit{Airbnb, Uber Cast Themselves As Saviors of the Middle Class}, S.F. CHRONICLE (Nov. 10, 2015, 8:16 PM), http://www.sfchronicle.com/business/article/Airbnb-Uber-We-are-the-saviors-of-the-middle-6620729.php.

\textsuperscript{144} Uber has operated by paying drivers’ fines in Paris, though this appears to be a temporary measure. Alderman, \textit{supra} note 59.

\textsuperscript{146} See id. at 109-13; Scheiber, \textit{supra} note 63.

\textsuperscript{147} See New State Ice Co. v. Liebman, 285 U.S. 262, 311 (1932) (Brandeis, J., dissenting) (“It is one of the happy incidents of the federal system that a single courageous state may, if its citizens
change is usually possible at the state and local levels makes regulatory entrepreneurship more feasible within the “runway” of capital, or timeline, the company has to operate.\textsuperscript{148}

Further, state and local political fights generally attract much smaller amounts of resources than national fights do.\textsuperscript{149} It takes less money to make waves in state and local politics; at the national level, even a significant amount of money can be lost as a drop in the bucket. For example, consider the 2013 mayoral race in New York City, the nation’s largest and wealthiest city. Two months before the election, the \textit{New York Times} reported that in the course of the campaign the candidates had mustered a combined total of approximately $35 million and spent about $30 million.\textsuperscript{150} In the 2014 New York gubernatorial campaign, the candidates spent a combined total of approximately $55 million.\textsuperscript{151} In the 2012 Presidential campaign, President Barack Obama and Mitt Romney’s campaigns raised and spent roughly a billion dollars each,\textsuperscript{152} spending on all federal elections in 2012 totaled approximately $7 billion.\textsuperscript{153} Spending enough money to have a significant effect at that level can be prohibitively expensive.\textsuperscript{154}

---

\textsuperscript{148} See John F. Coyle & Joseph M. Green, \textit{Contractual Innovation in Venture Capital}, 66 HASTINGS L.J. 133, 151 (2014) (noting that startup companies typically refer to the “runway” of capital they have raised for a certain period of operations).

\textsuperscript{149} See The Money Behind the Elections, OpenSecrets.org, available at https://www.opensecrets.org/bigpicture/ (last visited Feb. 1, 2016) (showing that the costs of federal congressional and presidential races in recent years have been in the billions versus state contributions each significantly less).

\textsuperscript{150} \textit{How Much the N.Y.C. Mayoral Candidates Have Raised and Spent}, N.Y. TIMES (Sept. 2, 2013), http://www.nytimes.com/interactive/2013/03/16/nyregion/how-much-the-nyc-mayoral-candidates-have-raised-and-spent.html?_r=0. These totals included potential candidates who had not officially declared their candidacies, as well as money that a candidate borrowed or transferred from another campaign. \textit{Id.}

\textsuperscript{152} \textit{The 2012 Money Race: Compare the Candidates}, N.Y. TIMES, http://elections.nytimes.com/2012/campaign-finance. These numbers include amounts raised by the candidates, the national party committees, and each candidate’s chief Super PAC, but not other PACS or each candidate’s victory fund. \textit{Id.}

\textsuperscript{154} It is also worth noting that there are limits to what money can accomplish politically. Some economists have argued that campaign spending is much less influential than the conventional wisdom would dictate, and some donors have lamented that they are unable to buy more influence. See, e.g., Stephen J. Dubner, \textit{How Much Does Campaign Spending influence the Election? A Freakonomics Quorum}, FREAKONOMICS (Jan. 17, 2012), http://freakonomics.com/2012/01/17/how-much-does-campaign-spending-influence-the-election-a-freakonomics-quorum/; Eliza Collins, \textit{Charles Koch Bemoans Lack of Influence Over 2016 Race}, POLITICO (Jan. 8, 2016), http://www.politico.com/story/2016/01/charles-koch-2016-presidential-race-217499#.chuesce:A0Og; Matthew Cooper, \textit{Koch Brothers Money Hasn’t Bought As Much As You Think}, NEWSWEEK (Apr. 24, 2014), http://www.newsweek.com/2014/05/02/koch-brothers-money-hasn't-bought-much-you-think-248390.html. On the other hand, money clearly
Another advantage of targeting state or local laws is the added flexibility. The large number of state and local jurisdictions enables companies to pick their battles in ways that increase their chances of success over time. The entrepreneur can start with the jurisdictions that it finds most promising, or hold off on targeting a particular location of interest until conditions are favorable. It can decide to abandon a particular strategy, delay, or expand. Moreover, the entrepreneur does not have to win every battle to achieve some measure of success. These options are generally not available when the law in question is national.

Further, flexibility is useful because political environments fluctuate over time, and changing political headwinds can make it easier or harder to exert influence and alter the law. These fluctuations are driven by economic and social conditions that are generally difficult or impossible to deliberately influence. Similarly, politicians rise and fall. An entrepreneur may benefit from the popular strength of a sympathetic official, or the weakness of an antagonistic one. For instance, in 2009, billionaire Michael Bloomberg spent $102 million of his own money to help finance his successful mayoral campaign. Non-billionaire Bill de Blasio spent about one tenth of that during his successful campaign four years later. If an entrepreneur were looking to use its money to pressure the mayor’s office, it might well find that its chances were much better during the latter’s time in office. Conversely, if the mayor’s office favored the entrepreneur’s proposed change, acting earlier might have been preferable.

There are also tactics available at the state and local level that are not available at the national level. For example, in 2014, Uber wanted to open in Portland, but faced opposition from the city government. In response, Uber began offering service in Vancouver, Washington, which is a stone’s throw away from Portland, then sent the message “Hey Portland, we are just across the river . . .

DraftKings and FanDuel are an example of this approach. According to one source:

[They] have chosen which states to operate in based on the individual rules in that state, which vary . . . As recently as October, the two companies were operable in 45 states—in the other five, they had chosen not to operate because the law appeared unfriendly. Very recently, that number has gone to 44 after Nevada’s Gaming Control Board ruled these companies gambling operators. It now threatens to go down to 43 because of New York.

Uber proceeded to begin offering service in several adjacent suburbs of Portland. As Portland’s mayor described the experience, “They basically forced their way into the market and surrounded us, then put the pressure on for us to do likewise.” Strategies such as that, which rely on geographic proximity, are less likely to work well when applied at the national level; it seems harder to imagine a company pushing through a legal change in the United States on the grounds that Canada and Mexico both adopted it.

And, because regulatory entrepreneurship is a form of politicking, it is better-suited to the more political branches of government. An army of users is more likely to be a compelling tool against executive and legislative bodies than judicial ones. Judges are particularly unlikely to be swayed by popular opinion if their terms are longer and if they are appointed instead of elected. This further advantages state battles over federal ones; in many states and cities, judges are elected, while judges in federal district and appellate courts are appointed for life. On the other hand, when a company finds itself in court, the longer that it can drag out the proceeding, the more time it may have to grow its user base and lobbying arm and push for a legal change.

For example, DraftKings and FanDuel had been operating in the shadow of the law, each spending more than $100 million on television advertising and signing up tens of thousands of users each day, before receiving a cease-and-desist order from the New York state attorney general. The attorney general wrote: “It is clear that DraftKings and FanDuel are the leaders of a massive, multi-billion dollar scheme intended to evade the law and fleece sports fans across the country.” Both companies continue to operate, attempting to rally users to support their legal cause, and have each filed lawsuits seeking an injunction.

161 Id.
162 See Judith Resnik, Judicial Independence and Article III: Too Little and Too Much, 72 S. CAL. L. REV. 657, 666 (1999); Shirley S. Abrahamson, Thorny Issues and Slippery Slopes: Perspectives on Judicial Independence, 64 OHIO ST. L.J. 3, 9 (2003) (“In exercising judicial independence, the stakes for the judges, that is, the loss of the judgeship, are clearly higher for judges with limited terms than they are for appointed judges with life tenure.”).
against the cease-and-desist order. 166 DraftKings retained the same high-profile lawyer who represented Al Gore in the 2000 presidential election. 167 The company filed a petition against the attorney general, seeking to stop him “from carrying out his threat to banish from this State a lawful industry beloved by hundreds of thousands of New Yorkers.” 168 FanDuel has taken a similar approach. The legal battles may drag on for significant periods of time, while they continue to grow and encounter battles in other states. 169

Many of the highest-profile companies that attempted a regulatory entrepreneurship strategy and failed did so because they found themselves fighting national laws in federal courts. One of the most famous examples was Napster, the peer-to-peer file sharing program. 170 Many of the files shared on Napster were copyrighted works, and the Recording Industry Association of America ultimately sued Napster in federal court for contributory and vicarious infringement of copyright. 171 The suit brought Napster publicity and further grew its user base, but this did not help Napster when it lost in court. 172 Napster was eventually forced into bankruptcy. 173 Other companies in the same space have encountered similar problems, including Grokster, Kazaa, MusicCity, and Limewire. 174

More recently, Aereo lost a high-profile Supreme Court case regarding the legality of its business. 175 Aereo’s business model was based on making television content that networks broadcast over the airways available to subscribers via streaming over the Internet. 176 This raised questions of copyright infringement. 177 Aereo attempted to lobby the FCC and Congress for changes in the relevant laws and regulations, both before and after it lost in court, but ultimately failed and had to enter bankruptcy. 178

177 See id.
Of course, there have been some regulatory entrepreneurs who have succeeded with regulatory entrepreneurship strategies in federal court. In the early days of videocassette recorders (VCRs), it was unclear whether their use on copyrighted programming constituted copyright infringement. If so, the manufacturers were potentially liable and the business model would not have been viable. However, the VCR manufacturers successfully won in the Supreme Court, saving the business.

The early days of Federal Express provide another good example of a company making its business viable by changing the law at the federal level. Federal Express was founded in 1971, and in 1976 it began lobbying hard for the deregulation of air cargo transport. It succeeded in 1977—a very rapid turnaround for a change in federal law. But in some ways this example shows how rare this kind of success can be, as a number of factors came together in ways that Federal Express could neither have controlled nor predicted. First, Flying Tiger Line, Federal Express’s largest competitor, completely changed its position on the existing statutory regime and joined Federal Express in pushing for deregulation. This was especially notable because the chair of the House Subcommittee on Aviation, which had killed Federal Express’s prior attempts to change the law, represented the district in which Flying Tiger’s headquarters were located. Second, Federal Express benefited from a number of useful allies—in particular Alfred Kahn, the Chair of the regulatory body charged with overseeing Federal Express. This confluence of factors is rare, and generally beyond the control of the regulatory entrepreneur.

179 See Jessica Litman, Campbell at 21/Sony at 31, 90 WASH. L. REV. 651, 666-67 (2015) (describing how even after oral argument in Sony, the majority of Supreme Court justices were initially inclined to affirm the Ninth Circuit’s copyright infringement ruling).

180 See id. at 664 (noting that Sony “was making a significant amount of money selling devices designed to copy copyrighted television programs” and describing this as “the trumpet problem” of “making money because of works written by others”); see also JAMES LARDNER, FAST FORWARD (2002).

182 This is perhaps a border case of regulatory entrepreneurship. Fed Ex was not started, nor did it begin cargo delivery, planning to or thinking that it needed to change the law. Instead, after its strategy of navigating the existing regulations failed, it later decided that it needed to change the law to be viable, and succeeded in doing so. For an excellent discussion of the FedEx case, see Jill E. Fisch, How Do Corporations Play Politics?: The FedEx Story, 58 VAND. L. REV. 1495 (2005).

C. The Prevalence of Startups as Regulatory Entrepreneurs

Finally, in addition to the general business and law-related factors at play, it seems significant, and not random, that startup companies seem to represent a disproportionately large share of regulatory entrepreneurs. There are several reasons for startups’ relative prevalence or edge over more established businesses in the area of regulatory entrepreneurship.

First, by their nature regulatory entrepreneurs are innovators. A large body of literature examines startups and established companies’ relative merits at fostering innovation and new technologies.188 There may be a historical aspect to this narrative of innovation, as before 1980, fewer than 200 very large and established corporations accounted for most R&D in the United States.189 But since 1980, the growth in private R&D in the U.S. economy is attributable to relatively small and new companies.190

Second, as discussed in Part II, “guerilla growth” is one of the key tactics that regulatory entrepreneurs have deployed. When deployed successfully, companies become “too big to ban” before regulators can crack down. The regulators’ timeline is difficult for an entrepreneur to control. Thus, the success of this strategy hinges on the entrepreneur’s ability to enter a market and grow as quickly as possible.

Silicon Valley startups are known for trying to grow their user base as quickly as possible and to worry about making money later.191 For years, startups

POST (Sept. 13, 2013), http://business.financialpost.com/fp-tech-desk/twitter-s-road-to-ipo-grow-first-monetize-later?__lsa=61db-bf2c (discussing companies like Twitter, Facebook, Dropbox, and Pinterest that had a “grow first, monetize later” philosophy); Nitasha Tiku, Look At How Quickly the Values of Multi-Billion-Dollar Startups Have Multiplied, THE VERGE (Feb. 20, 2015), http://www.theverge.com/2015/2/20/8075053/look-at-how-quickly-the-value-of-multi-billion-dollar-startups-have ("Build momentum now, figure out how to make money later—otherwise,
have been entering businesses that did not have well-established precedents. It was not always clear what the best way would be for these businesses to monetize their user base. However, the industry consensus was that (1) it would be possible to monetize the user base—that is, the business would be profitable, one way or another—and (2) more users were essential to the company’s long-term value. A list of examples in this vein comes quickly to mind, such as YouTube, Facebook, Twitter, and Instagram. This created an environment in which industry executives prioritized rapid growth and users over profits. Over time, this produced an increased focus on how to achieve rapid growth, which in turn led to the development of people with expertise in how to accomplish this goal.

By and large, many of these companies have become viewed as big success stories. These successes have been supported by an ecosystem of

---

194 See Frier & Newcomer, *supra* note 191 (noting that a “tech startup’s cash flow is less important than you might think” but investors “look to find the number of people using the product, regardless of whether they pay for it”); Claire Cain Miller, *Popularity or Income? Two Sites Fight It Out*, N.Y. TIMES (Oct. 20, 2008), http://www.nytimes.com/2008/10/21/technology/start-ups/21twitter.html?_r=1&hp (discussing several high profile tech startups that succeeded with a strategy of prioritizing user growth rather than profits); Dan Primack, *Tech IPOs: Profits Don’t Matter*, FORTUNE (Mar. 26, 2014), http://fortune.com/2014/03/26/tech- IPOs-profits-dont-matter/ (noting that “profits don’t really matter when it comes to tech IPOs” and “[t]oday’s IPO buyers care about two key metrics: (1) Growth. (2) Total available market, into which that growth can be realized.”); Eric Kutcher et al., *Grow Fast or Die Slow*, Mckinsey & Co. (April 2014), http://www.mckinsey.com/industries/high-tech/our-insights/grow-fast-or-die-slow (“Growth trumps all.”).

195 Either because they succeeded in becoming profitable, were purchased by other companies at large valuations, or conducted successful initial public offerings. *See, e.g.*, Miller, *supra* note 194 (“Successes like YouTube, the online video site sold to Google for $1.65 billion in 2006, convinced some venture investors that building a Web site with a large number of users could still be more valuable than making money from paying customers.”); Larry Popelka, *What We Learned From Twitter’s IPO: The Value of Innovation Is at an All-Time High*, BLOOMBERG (Nov. 18, 2013), http://www.bloomberg.com/bw/articles/2013-11-18/what-we-learned-from-twitter-s-ipo-the-value-of-innovation-is-at-an-all-time-high (noting that Twitter had a successful IPO, becoming one of the most valuable companies in the world at a $25B valuation based not on profit but on the value of its great innovation).
investors who are willing to accept large amounts of risk and uncertainty, support growth-focused strategies, and take a long-term view. Angel investors, many of whom are successful ex-entrepreneurs, and the venture capital market make early-stage financing feasible for high-risk, high-return businesses. Most angel investors like being involved in exciting new ventures, and view the potential to disrupt entire industries as an added bonus. Thus, startup investors are willing to take the long view of companies’ business prospects, even those companies that have never operated profitably. For example, although neither DraftKings nor FanDuel has yet proven profitable, each startup company is already valued at close to $1 billion. Airbnb, valued at almost $25 billion, forecasts that its business will lose $150 million in 2015, and that it will not be profitable (even excluding interest, taxes, depreciation, and amortization) until 2020. Uber, whose valuation of over $60 billion makes it the world’s most valuable private startup, loses “boatloads of money,” reporting net operating losses of $470 million on $410 million in revenues.

In contrast, established businesses and their investors tend to operate on more well-trodden ground. For example, coal mining is an old business with a long track record. There are clearer expectations for how a coal mine will make its money—it is going to sell coal. There are many other coal mining companies, and previous years of the company’s own operating results, to compare the company’s performance against. It is easier to evaluate how well the business is performing, and it is harder for an established company to argue that big, positive changes are looming on the horizon.

196 Legal risks are just one of many types of bet-the-company risks that startup companies may be facing, and often is not even identified as one of the top risks in startup companies. See Sreekanth Ravi, When Launching Your Startup, Consider These 5 Risks, ENTREPRENEUR (May 21, 2014), http://www.entrepreneur.com/article/234094 (discussing product risk, market risk, financial risk, team risk, and execution risk); Thomas Oppong, The 10 Biggest Risks That Prevent VCs From Funding Your Startup, ALL TOP STARTUPS (Aug. 27, 2014), http://alltopstartups.com/2014/08/27/biggest-startup-risks/ (noting venture capitalist Marc Andreessen listed the following as risks that will cause potential investors to decide not to invest: founder risk, market risk, competition risk, timing risk, financing risk, marketing risk, technology risk, product risk, hiring risk, and location risk).

198 See Ibrahim, supra note 197, at 1412, 1419.

Similarly, endeavoring to change the law is hazardous. Politics is a complicated arena with many competing interest groups and sources of uncertainty. It is difficult to predict whether an attempt to change the law will succeed, or what unintended consequences it might produce, on the legal system or otherwise. Startups without established businesses have little to lose economically from such shakeups. Culturally, startups often pride themselves on being disruptive and changing the world; startup employees tend to view these shakeups optimistically. One prevalent cliché about startups, sometimes mocked in popular culture, is that they attract people who “want to make the world a better place.” Startup entrepreneurs are “socialized to believe that most problems can be fixed with enough money and engineering.” Furthermore, startup culture, particularly in Silicon Valley, has become known to foster a certain libertarian-leaning, free-market ideology that views technology that appeals to the masses as democratic. Given this confluence of factors, it is not surprising that startups might be inclined to “Move Fast and Break Things,” as Facebook’s motivational posters implored its employees to do.

Established companies, almost by definition, have stable, profitable businesses. This gives them reason to worry about radical changes to the law that might undermine or even eliminate those businesses; no one wants to kill the golden goose in attempt to get more eggs. Moreover, a new and uncertain line of business will demand a large amount of managers’ finite attention, which can detract from the company’s already-developed business lines. Established companies might also be dissuaded from pivoting their business models to ones

---

205 Paul Carr, Travis Shrugged: The Creepy, Dangerous Ideology Behind Silicon Valley’s Cult of Disruption, PANDO (Oct. 24, 2012), https://pando.com/2012/10/24/travis-shrugged/ (“To proponents of Disruption, the free market is king, and regulation is always the enemy.”); Fung, supra note 204 (“A belief in permissionless innovation is what gives the tech industry its libertarian streak.”); Gregory Ferenstein, Silicon Valley Represents An Entirely New Political Category, TECHCRUNCH (Nov. 8, 2015), http://techcrunch.com/2015/11/08/silicon-valley-represents-an-entirely-new-political-category/ (noting that author conducted a political psychology study of the tech industry and “[t]he results suggest that Internet startup founders represent an entirely distinct, libertarian-like ideology within the Democratic party. Tech startup founders see the government as an investor in citizens, rather than as a protector from capitalism.”).

that require regulatory entrepreneurship because they fear the bad press that might come from being seen as operating in a legal gray area or breaking the law. More generally, established businesses and customer relations require a certain degree of stability and predictability. They tend to be larger and thus have more levels of internal hierarchy. Their employees tend to be older than startup employees, and they tend to attract employees who prefer the more stable prospects that come from working at an established business to high-risk, high-reward startup employment.

Despite these obstacles, established companies are capable of engaging in regulatory entrepreneurship as well. Google is perhaps the best example. Its founders have remained committed to taking on big and complex problems and applying creative solutions, and warned prospective IPO investors that Google would continue to take on moonshot projects after it went public.\footnote{Alphabet Investor Relations, 2004 Founders’ IPO Letter From the S-1 Registration Statement, “An Owner’s Manual” for Google’s Shareholders, available at https://abc.xyz/investor/founders-letters/2004/ipo-letter.html (“We will not shy away from high-risk, high-reward projects because of short term earnings pressure. . . Do not be surprised if we place smaller bets in areas that seem very speculative or even very strange when compared to our current businesses.”).} One of the company’s most important moonshot investments is the self-driving car project.\footnote{Steven Levy, Google’s Larry Page on Why Moon Shots Matter, WIRED (Jan. 17, 2013, 6:30 AM), http://www.wired.com/2013/01/ff-qa-larry-page/; Alex Knapp, Nevada Passes Law Authorizing Driverless Cars, FORBES (June 22, 2011); Dino Grandoni, Among the States, Self-Driving Cars Have Ignited a Gold Rush, N.Y. TIMES (Aug. 6, 2015), http://www.nytimes.com/2015/08/07/automobiles/self-driving-cars-ignite-gold-rush-among-states.html.} This project always had at its heart the obstacle that it would have to change the law to be viable. To date, Google is a leader in self-driving car technology, and has persuaded California, Florida, Michigan, Nevada, and Washington D.C. to pass laws that allow public road testing.\footnote{Edward B. Rock, Shareholder Eugenics in the Public Corporation, 97 CORNELL L. REV. 849, 900 (2012); Steven Davidoff Solomon, New Share Class Gives Google Founders Tighter Control, N.Y. TIMES DEALBOOK (Apr. 13, 2012, 9:17 AM), http://dealbook.nytimes.com/2012/04/13/new-share-class-gives-google-founders-tighter-control/; Steven Davidoff Solomon, Thorny Side Effects in Silicon Valley Tactic to Keep Control, N.Y. TIMES DEALBOOK (Sept. 3, 2013, 5:16 PM), http://dealbook.nytimes.com/2013/09/03/thorny-side-effects-in-silicon-valley-tactic-to-keep-control/.}

Yet Google is, in some ways, the exception that proves the rule. Though now a well-established company, it began as a startup that experienced tremendous success, and its startup culture persists, at least in part. Further, Google’s founders put in place a dual-class stock structure which guaranteed that they would retain control of the company and could not be forced to change course by dissatisfied outside investors.\footnote{Thorny Side Effects in Silicon Valley Tactic to Keep Control, N.Y. TIMES DEALBOOK (Sept. 3, 2013, 5:16 PM), http://dealbook.nytimes.com/2013/09/03/thorny-side-effects-in-silicon-valley-tactic-to-keep-control/.} This structure, combined with the perception that they are visionary tech leaders and the deference that the market is willing to accord them as a result, gives Google significant freedom to engage in regulatory entrepreneurship, as well as take on other types of risky projects.
Even so, investors became increasingly uneasy about both the amount and opacity of Google’s spending on far-out technology projects that were unrelated to its core business of advertising and search. Ultimately, Google responded to mounting investor pressure by embarking on a major reorganization of its business. According to one former Google executive: “It was getting harder and harder to hide the costs of some of the company’s projects,” especially as some of these speculative ventures were bound to fail, and “It’s easier to take the core business and run it like a Fortune 500 company.”

Google, Inc. recently restructured to a holding company, Alphabet, Inc., with a host of subsidiaries. Under the new structure, Alphabet has partitioned off the moonshot technology projects into a separate subsidiary, X, framed as Alphabet’s incubator. The projects that turn into viable businesses will be spun off or “graduated” as their own standalone companies. Google’s self-driving car project is expected to “graduate” into its own company soon.

**IV. THE FUTURE OF REGULATORY ENTREPRENEURSHIP**

In this final Part, we explore how regulatory entrepreneurship will likely continue to shape our laws in the years to come.

**A. The Prospects for Regulatory Entrepreneurship Going Forward**

The factors that we examined in Part III offer insight into the likely prevalence of regulatory entrepreneurship going forward. Anticipating the law-related factors necessarily means making some predictions about the course of politics and future policy making, which is a difficult prospect at best. We simply note that the national government is currently divided and gridlocked due to increased political polarization, and that this state of affairs may continue for some time. If so, relative inaction by the national government in many spheres

---

212 Id.

215 See Barr & Winkler, supra note 211.

216 Bergen, supra note 214.

will leave more issues for state and local governments to address, and more room for those governments to maneuver.\textsuperscript{218} This could produce a more favorable legal landscape for regulatory entrepreneurship.\textsuperscript{219}

Similarly, future prospects for regulatory entrepreneurship will depend on the health of the ecosystem that supports and promotes startups. A mature industry has arisen around providing startups with capital; this has come with infrastructure—such as people with experience evaluating startup investment opportunities—that is likely to prove durable.\textsuperscript{220} Venture capital is a crucial part of the ecosystem, but it includes other participants as well such as angel investors, accelerators, and incubators.\textsuperscript{221} In addition, recent legal changes have opened up new avenues for investment in startups.\textsuperscript{222} Also importantly, investors have become increasingly comfortable with regulatory entrepreneurship as a business strategy, and the infrastructure that has been assembled to date will facilitate this on an ongoing basis.

But perhaps the most important factors for the future of regulatory entrepreneurship are business-related. As noted previously, the growth of platform companies has been a significant driver of increased regulatory entrepreneurship. One might therefore expect that the prospects for regulatory entrepreneurship are tied, at least in part, to the fate of new platform companies.

There are some reasons to think that new platform companies will have issues achieving large, connected user bases and significant amounts of capital. Both of these are important for regulatory entrepreneurship: Skillful use of a large, connected user base has become arguably the most effective weapon in the modern regulatory entrepreneur’s arsenal. Money is also important—companies that can credibly threaten to commit lots of resources to political battles, and to be able to stay in the game for the long haul, are more likely to succeed than those that cannot.\textsuperscript{223}

\textsuperscript{218} Moreover, at the federal level, congressional gridlock makes it more likely that Presidents will seek to accomplish their political goals through administrative agencies and other executive actions. To the extent that it is easier (harder) for companies to influence executive action, this will further promote (discourage) regulatory entrepreneurship.
\textsuperscript{219} See supra Part III.B.
\textsuperscript{221} Brad Bernthal, Investment Accelerators, STANFORD J.L. BUS. & FIN. (forthcoming 2016); Ibrahim, Angel Investors, supra note220; Dana Thompson, Accelerating the Growth of the Next Generation of Innovators, 8 OHIO ST. ENTREPRENEURIAL BUS. L.J. 279 (2013).
\textsuperscript{223} See, e.g., DRUTMAN, supra note 10, at 238; Helderman, supra note 76.
One issue that platform companies face is that they are, by their nature, middlemen who profit from facilitating transactions between other parties. Consequently, the parties the platform connects have an incentive to try and cut the platform company out of the transaction.\textsuperscript{224} In many instances, this may be achievable.\textsuperscript{225} Circumvention is generally a manageable problem for Airbnb and Uber because of the nature of their underlying businesses. Travelers usually go to different places over time, so they cannot simply reuse the same Airbnb host over and over. Uber passengers usually want to find the driver closest to their location at the moment they need a ride. This is not easy to do without their app. There are other platform companies whose business models provide similar safeguards against being easily circumvented.\textsuperscript{226} But, for many platform companies, this is a major issue that can greatly undermine the user base and financial resources that the company needs to be politically effective.\textsuperscript{227} Furthermore, even if a new platform company did not suffer from circumvention issues, regulatory entrepreneurship will only be appealing if there is a potentially changeable law that materially affects the value of the business. Combined, this would seem to suggest that only a narrow range of businesses stand to gain from a regulatory entrepreneurship strategy.

However, we believe that there is an even stronger argument that the business fundamentals favor increased regulatory entrepreneurship in the years to come. This argument is sometimes referred to as the “back half of the chessboard” argument.\textsuperscript{228} The name of this argument comes from a legend that the inventor of chess was brought before the king, who offered him a reward for his great invention. The inventor asked for a grain of rice to be placed on the first square of a chessboard; then two grains on the second square the next day; four grains on the third square the day after; eight grains on the fourth square the day after that, and so on, doubling the previous day’s total each day until the sixty-

\textsuperscript{224} Cf. Jordan Barry et al., \textit{Voluntary Transaction Costs} (giving a similar example in more detail).

\textsuperscript{225} For example, imagine a platform that connects people who need haircuts to stylists, similar to Glamsquad or StyleBee. The stylist and customer, once they have been introduced, can easily contact each other to conduct future business without going through the platform.

\textsuperscript{226} For example, Cherry allowed people to park anywhere and then call someone nearby to clean their car. The importance of the car washer’s proximity, much like that of an Uber driver, made it more difficult to circumvent the company’s app. However, the company—which likely would have needed to change zoning laws in many cities for its business to successfully scale up in the long run—went out of business because of low transaction volume. See Semil Shah, \textit{Iterations: Lessons We Can Draw from Cherry}, \textsc{TechCrunch} (Jan. 13, 2013), http://techcrunch.com/2013/01/13/iterations-lessons-we-can-draw-from-cherry/.

\textsuperscript{227} See, \textit{e.g.}, Zeel (provides massage therapists); Your-Mechanic (sends mechanics); TutorSpree (connected people with tutors, but was shut down); Urban-sitter (sends babysitters); Washio (laundry pick-up and delivery); DogVacay (pet-sitting services); Instacart (grocery shopping services); BloomThat (flower delivery); Pager (doctors); Glamsquad (hair and makeup stylists); Eaze (medical marijuana delivery).

fourth day. The king agreed. Only later did he realize that he had promised the inventor more rice than has been produced in the history of the world, and that the agreement has bankrupted his kingdom.  

Like the grains of rice on the chessboard, technological progress tends to exhibit exponential growth. This has been particularly true of the computer industry; for the last fifty years, computer technology has doubled in power approximately every two years. This is sometimes referred to as Moore’s law, after the author of the paper that first predicted this pattern. When Moore first wrote his paper, the degree to which computers would increase in computational power, while becoming smaller and more affordable, was almost impossible to appreciate. Even with the benefit of hindsight, it is difficult to wrap one’s head around this meteoric growth; many individuals now carry more computing power in their pockets than NASA possessed at the time of the moon landing. And, assuming that Moore’s law continues to hold, the next few years will add more computing power than the past fifty years, combined—and then the next few years will add much more still.

It is hard to predict exactly how all of this additional computing power will be used. However, it seems a safe bet that we will be increasingly connected and accessible—which will give companies new ways to mobilize large groups of people on their behalf. Companies are also likely to have more data about their users, and greater ability to organize and analyze this information.

229 Accounts differ as to whether, upon this discovery, the king rewards the inventor for his cleverness by making him a high-ranking advisor, or executes him for tricking the king. See Malba Tahan, The Man Who Counted: A Collection of Mathematical Adventures 113-15 (1993); Second Machine Age, supra note 228, at 45-47.

230 This is because technological gains feed into each other, so that today’s gains lead to greater gains in the future.

231 More precisely, the number of transistors in a dense integrated circuit doubles approximately every two years.

233 See, e.g., Nick Carr, How Many Computers Does the World Need? Fewer Than You Think, GUARDIAN (Feb. 20, 2008), http://www.theguardian.com/technology/2008/feb/21/computing.supercomputers (“In the early 1940s, IBM’s President, Thomas J. Watson, reputedly said: ‘I think there is a world market for about five computers.’”).

235 There have been many predictions that Moore’s Law will fail over the last fifty years. To date, they have all proved wrong. For example, Gordon Moore himself predicted in 1995 that Moore’s Law wouldn’t hold after 2005. He then updated his prediction in 2005, predicting that it would last until between 2015 and 2025. In 2015, he updated once again, saying that it would end in 2025. See The End of Moore’s Law, THE ECONOMIST, Apr. 19, 2015, http://www.economist.com/blogs/economist-explains/2015/04/economist-explains-17 (collecting these and other examples).

This will make companies better able to channel and leverage their users for maximum effect. All of this suggests that regulatory entrepreneurship will be an increasingly attractive proposition and that we will therefore see more of it, even if we cannot quite anticipate the exact form that it is likely to take.

B. How Regulatory Entrepreneurship Will Affect Legislation

Because regulatory entrepreneurship may become an increasingly common phenomenon, we believe that its effects on lawmaking merit careful consideration. We begin with a discussion of scholarly accounts of the political process and how they relate to regulatory entrepreneurship generally. We then turn to some well-known political pathologies and consider the extent to which regulatory entrepreneurship might ameliorate them. Finally, we consider the limits of regulatory entrepreneurship’s potential to improve political outcomes and assess its likely effects overall.

1. The Political Process

The democratic political process involves a messy, complicated interplay of different groups of people pursuing varied goals. Political scientists and economists have proposed a number of frameworks for understanding this process and its outputs.

One of the most famous and most popular has come to be known as the “Bootleggers and Baptists” framework.237 This name comes from the observation that both bootleggers and Baptists supported laws restricting liquor sales. The latter supported these laws because they opposed the consumption of alcohol. The former clearly had no such compunction; instead, they wished to profit by restricting competition from legal sales of alcohol. Although these seemingly opposed groups had very different preferences and aims, both supported regulations on liquor sales and were instrumental in their enactment. The Baptists fulfill important public roles, including presenting a sympathetic face on the legislation, building popular support, and providing “moral cover.”238 The bootleggers work behind the scenes, contributing resources and “lubricat[ing] the political machinery.”239

238 Randy T. Simmons et al., Bootleggers, Baptists, and Political Entrepreneurs: Key Players in the Rational Game and Morality Play of Regulatory Politics, 15 INDEPENDENT REV. 367 (2011); Yandle, Bootleggers and Baptists in Retrospect, supra note 267.

239 Simmons et al., supra note 238, at 368.
The bootleggers and Baptists model produces several important insights, but for our purposes two are paramount. First, when pursuing one’s self interest—that is, when one is a bootlegger, seeking a policy change for profits—having a good altruistic cover (that is, Baptists) is very helpful.

The most successful modern regulatory entrepreneurs have proved adroit at finding sympathetic groups to serve as the public faces for their issues. They are, in a sense, bootleggers who create their own Baptists. For example, consider how Uber fights political battles with taxi regulators and local governments. As much as possible, Uber makes the public face of the issue its drivers, who stand to lose their livelihoods, and its riders, who face unmet transportation needs.240 Similarly, Airbnb uses hosts who need to rent out spare rooms in order to make ends meet;241 Airbnb’s opponents have worked hard to put less appealing faces on the issue.242

Companies who do not have ready-made, photogenic Baptists have had more difficulty achieving their political goals. For example, consider Tesla Motors’ options for garnering mass public support. Until recently, its cheapest car had a $70,000 price tag, which is well out of most people’s price range, and its distribution centers do not hire large numbers of low-income workers.243 Tesla has made other arguments to support its regulatory aims, but they have not always resonated with the public.244 DraftKings and FanDuel have tried to make their users their public face of their fight, lamenting that state governments are preventing their users from playing games that they enjoy;245 but may have difficulty selling this argument.246 Google’s self-driving cars are haunted by public concern that driverless cars will eliminate thousands of existing jobs.247

---

240 Uber, supra note 132.
241 See supra notes 124-127 and accompanying text.
242 See supra notes 128-131 and accompanying text.
244 Tesla has made arguments based on the beneficial impact its cars will have on the environment, particularly with respect to carbon emissions, and by appealing to the principle of consumer freedom. See, e.g., Musk, supra note 46. The former argument seems undermined by the significant percentage of people who do not believe in climate change and the latter by the fact that the consumers in question have high incomes and other good car-buying options, perhaps making them less sympathetic to many voters.
245 Kulwin & Wagner, supra note 78.
246 This is a tricky maneuver because the sites’ large number of casual players might not care about the issue and the vast majority of winnings on these sites go to a small group of sophisticated players who enter hundreds of contests a day and use advanced mathematical techniques to maximize their profits. See, e.g., Joshua Brustein & Ira Boudway, You Aren’t Good Enough to Win Money Playing Daily Fantasy Football, BLOOMBERG (Sept. 10, 2015), http://www.bloomberg.com/news/articles/2015-09-10/you-aren-t-good-enough-to-win-money-playing-daily-fantasy-football; Drew Harwell, All the Reasons You (Probably) Won’t Win Money Playing Daily Fantasy Sports, WASHINGTON POST, Oct. 12, 2015, https://www.washingtonpost.com/news/the-switch/wp/2015/10/12/all-the-reasons-you-probably-
The second important insight is that changing the law often requires action by multiple interest groups with divergent goals. This raises the question of how these groups coordinate their efforts; as one scholar put it, “It seems unlikely that the local Baptist preacher and the moonshiners meet in someone’s parlor to discuss banning Sunday [liquor] sales.”248 Someone or something else must act as intermediaries and coalition-builders, knitting together support from disparate groups in order to accomplish legal change.249

The dominant view is that, historically, politicians, and occasionally high-ranking bureaucrats, have taken on this role.250 Such politicians are sometimes described as “political entrepreneurs.”251

Regulatory entrepreneurs have some similarities to political entrepreneurs, but they differ in several key ways. First, political entrepreneurs usually take advantage of pre-existing, organized interest groups.252 Modern regulatory entrepreneurs, in contrast, have largely identified unorganized groups and mobilized them.253 “People for Deregulated Taxicabs,” “People for Short-Term Rentals,” and “Citizens Against Car Dealerships” were not established political groups that adopted the cause of Uber, Airbnb, and Tesla; instead, these companies organized people who were sympathetic to these positions and mobilized them to take action.

---

248 Simmons et al., supra note 238, at 368.
249 Sociologists Neil Fligstein and Douglas McAdam have recently theorized the nature of social change, from political movements to market meltdowns, and have included the idea of “internal governance units” which they define as organizations or associations who play a connecting role with state actors and who provide information to actors within a “strategic action field.” NEIL FLIGSTEIN & DOUGLAS MCADAM, A THEORY OF FIELDS 77 (2012).
250 Simmons et al., supra note 238, at 368.
251 See, e.g., id.; see also LEADERSHIP AND INNOVATION: A BIOGRAPHIC PERSPECTIVE ON ENTREPRENEURS IN GOVERNMENT (Jameson Doig & Erwin C. Hargrove eds., 1987). The term is also sometimes used to refer to businesses who pursue a rent-seeking strategy. See, e.g., Matthew McCaffrey & Joseph T. Salerno, A Theory of Political Entrepreneurship, 2 MODERN ECONOMY 552 (2011).
252 Simmons et al., supra note 238.
253 Justin Fox, Uber Is Lobbying for All of Us, BLOOMBERG VIEW (June 29, 2015).
Second, political entrepreneurs have usually had one of two primary (compatible) motivations: a values-based preference, rooted in ideology or otherwise, for a particular policy, or advancing their political careers. Regulatory entrepreneurs, in contrast, are primarily motivated by the desire to earn profits.

Third, while political entrepreneurs are individuals, usually elected officials, regulatory entrepreneurs are primarily privately owned businesses. One key implication of this pertains to how policies spread across jurisdictions. Because of the structure of the U.S. political system, politicians usually have bases of support centered on particular geographic areas. A mayor is well equipped to influence policy in her city, but her network strength is unlikely to reach other jurisdictions. It is true that successful mayors often parlay that success into election to statewide office, and that successful state politicians often parlay that success into national political office. However, the positions available at higher levels of government are structurally limited—the number of governors, members of Congress, and Presidents are fixed—which constrains the amount of movement that can occur up the chain, especially when incumbents’ well-documented electoral advantages are taken into account. Moreover, in our federalist system, different levels of government have dominion over different questions. Thus, many issues that a mayor might build a coalition around do not translate to state politics; the same issue applies for state politicians moving to the national political arena. Furthermore, politicians in the United States generally do not move among parallel levels of government; a successful mayor of San Diego is not likely to run for mayor of Los Angeles. Similarly, in modern U.S. political history, no candidate has ever been elected governor of two different states.

Businesses, in contrast, are not constrained in the same ways. The number of businesses of a particular size or operating in a given industry is not intrinsically fixed. More importantly, businesses are focused on growing their customer bases geographically in a way that politicians generally are not. Thus, a business that succeeds in establishing a winning electoral coalition that works at the city level in San Diego is much more likely to try to repeat its success in Los Angeles, or from one state to another.

Taken together, these differences suggest that regulatory entrepreneurship will lead to different coalitions being formed, and therefore different laws being enacted, than has been the case historically. Regulatory entrepreneurship seems most likely to have the largest effect on policymaking at the local and state level,

254 Martin O’Malley, for example, was elected Mayor of Baltimore, then Governor of Maryland, then unsuccessfully sought the Democratic Party nomination for President.
in the sphere of economic regulation, and to feature groups that are not currently as organized in American politics.

2. The Problem of Asymmetric Benefit Concentration

Every political process is imperfect,257 and ours is no exception. Scholars have documented a number of pathologies that can lead to inefficient outcomes.258 One common circumstance in which the political process can often produce suboptimal outcomes is when there are asymmetries between how a policy’s costs and benefits are distributed.

For example, consider a policy that produces concentrated benefits but diffuse costs—that is, it provides significant benefits to a relatively small group of people, while imposing relatively small costs on each member of a large group of people. In such circumstances, the beneficiaries of the proposed policy have a lot of incentive to fight for that policy. On the other hand, each of those who would be hurt by the policy has little incentive to resist it, since she would suffer only a small loss if it were enacted. These asymmetric incentives can result in the policy being enacted, even if the policy inflicts more aggregate harm to those hurt by it than it benefits the policy’s proponents.

There are a number of policy areas that embody this dynamic. Many involve incumbent members of an industry using legal restrictions to exclude potential competitors. This reduced competition enables the incumbent firms to charge higher prices, which can significantly raise their profits. Moreover, the incumbent firms are often organized into a trade association and, in some instances, a handful of firms may account for a large portion of total market share. This gives them strong incentive to push for these policies, and makes collective action easier. At the same time, the increased costs are spread over a large group of customers as well as would-be competitors. This gives each of the policy’s natural opponents little incentive to lobby against it and makes it difficult to organize and coordinate opponents’ efforts.

a. Occupational Licensing and Protectionism

There are several ways in which incumbents can enact protectionist legislation, but one of the best-known examples is occupational licensing—regulations that require individuals to obtain a government license or other

---

257 See KENNETH J. ARROW, SOCIAL CHOICE AND INDIVIDUAL VALUES (2d ed. 1970). According to Arrow’s “impossibility” theorem, there are no procedures for collective or social ordering of alternative choices that satisfy reasonable assumptions concerning the autonomy of the people and the rationality of their preferences. As such, there is no perfect set of decision-making processes or institutions. WILLIAM ROBERTS CLARK ET AL., PRINCIPLES OF COMPARATIVE POLITICS 11 (2d ed. 2012).

official permission to pursue a particular vocation or profession. Occupational licensing requirements have expanded dramatically in the last sixty years; in 1950, fewer than 5% of Americans worked in jobs that required licenses, versus roughly 10% in 1980 and more than 30% today.259 Clearly, occupational licensing can be useful;260 few people favor abandoning all licensing for surgeons or architects, for example. But licensing has spread far beyond the traditional professions, and many commentators have questioned the rationale for licensing occupations such as auctioneers, boxing timekeepers, and hair braiders.261 In many instances, securing these licenses can be extremely costly; for example, in some states, simply braiding hair for money requires years of classes and thousands of dollars in tuition.262

Overly protectionist occupational licensing has many problems. It makes it harder for workers to shift between industries, fueling unemployment. It makes products and services more expensive for customers and harder to obtain. It has been derided by politicians on both sides of the aisle, and the President recently proposed $15 million to study its effects, to applause from both the left and the right.263

Yet these rules have spread and proven difficult to fight because of the political economy dynamics.264 Regulated groups fight vigorously to keep their protections, but most voters pay little attention to these issues; elections rarely turn on the rules that govern hair braiders, opticians, interior designers, or athletes’ agents.265

260 Consumers may not be well equipped to evaluate the quality of certain specialized fields, and the cost of incompetence may be high.

262 See, e.g., Goldstein, supra note 261 (discussing one would-be hair braider’s experience in Utah, which requires “nearly two years of school and $16,000 in tuition”); Institute for Justice, Braiding Freedom Project, http://braidingfreedom.com/ (discussing similar rules in Washington, Missouri, and Arkansas, among others).

264 Timiraos, supra note 263.

265 See Edward J. Timmons & Anna Mills, Short-Sighted Policy, ECONOMIC INTELLIGENCE (Feb. 17, 2015); Matthew Yglesias, The Trouble with State Government, THINK PROGRESS (Feb. 28,
As a result, this problem has been a difficult one to crack. But regulatory entrepreneurship has made some inroads where more traditional politics has not. Restrictive taxicab regulations endured for decades nationwide, but Uber has transformed the landscape in a short amount of time. For example, in the last seventy-five years, New York City increased its cab fleet from approximately 12,000 cab medallions to 13,000. In Uber’s four years in New York City, it added almost 12,000 new for-hire cars to the city’s streets. Uber has had significant effects on taxi regulations in many other cities as well.

State laws requiring car manufacturers to sell through independent dealers are another form of entry restrictions or protectionism that have proved similarly durable, withstanding several efforts from the big car companies to repeal them. But in its decade of existence, Tesla motors has made real inroads against these laws, including convincing several states to pass new legislation that allows direct sales of automobiles to consumers.

b. Restrictive Zoning

Restrictive zoning regulations provide a second example of how asymmetric distribution of costs and benefits can produce questionable policy. Most people in the United States currently live in apartments or houses that they
own or rent for relatively long periods of time; in the past, a broader range of housing options were common. Many people were boarders, renting rooms in families’ homes; others lived in rooming houses or residential hotels. Over time, zoning rules made these increasingly scarce. A major driver of this process was that these restrictions, by reducing the supply of housing, created concentrated benefits for local homeowners by raising the value of their homes, while the costs were spread more diffusely. Over time, the restricted supply of housing has contributed to a dramatic increase in housing prices.

The restrictive zoning described above extends to other types of land use as well. Hosting a dinner party for your friends is legal, but if you were to serve the same dinner to paying customers, you would run afoul of regulations in many cities. Most cities require developments to set aside large amounts of space for parking. And so on. Taken together, these restrictions have had an enormous negative impact, producing massive demographic shifts, reducing economic growth, and damaging the environment.

Regulatory entrepreneurship has the potential to partially ameliorate some of these problems. For example, it does not seem coincidental that one of Airbnb’s toughest fights has been in San Francisco, a city with particularly restrictive zoning rules. San Francisco is located on a peninsula, so the only obvious way for the city to add housing units and business space is to grow vertically. Yet most of San Francisco’s neighborhoods restrict maximum building height to forty feet, and severely restrict how those buildings can be utilized. At the same time, local homeowners have strong incentives to resist

---

---
development, and they have done so—and the cost of residential and commercial real estate has soared. Airbnb, by enabling rental transactions that would otherwise not be possible, allows greater utilization of existing space and structures, effectively expanding the supply of real estate. Moreover, by allowing property owners and tenants to lease out unused residential space, Airbnb increases the range of uses to which property can be put. Similarly, Airbnb has launched a dinner sharing venture that allows users to host dinner parties—effectively turning residential property into small restaurants. Airbnb is hardly unique in this respect; many other regulatory entrepreneurs’ businesses undermine and reduce the impact of overly restrictive zoning regimes.

3. The Limits of Regulatory Entrepreneurship

While regulatory entrepreneurship can ameliorate some of the political economy problems described above, it is no panacea. The limits and potential downsides of regulatory entrepreneurship are considerable.

First, regulatory entrepreneurs’ ability to change the law will vary significantly depending on the nature of the business and the law in question; this creates real limits on regulatory entrepreneurs’ ability to effect legal change. As noted above, platform companies are particularly well-suited for regulatory entrepreneurship, but the platform model is not always a good fit for a particular business. Moreover, some policy problems are not well-suited to a business of any type; a successful business based around fundamental tax reform seems unlikely, for example.

Even when regulatory entrepreneurship is a viable business strategy, regulatory entrepreneurs are not saints or altruists; they are profit-seeking actors, and they will generally use their political power to further their profit-seeking goals. Simply put, regulatory entrepreneurs do not want to get the socially

---

282 Lobel, supra note 138.
283 Swan, supra note 274.
284 Examples abound. A number of other companies, including Eat With, SupperKing, Feastly, and LeftOverSwap have taken similar tacks to Airbnb’s dinner sharing business. Id. Cherry sought to turn every parking spot in San Francisco into a de facto car wash. See note 226, supra. HonkMobile, Parking Panda, Rover Park, WhereiPark, and other startups are turning residential driveways into commercial parking lots. Vanessa Lu, Parking Apps Will Allow Owners to Rent Out Parking Spots by the Hour, TORONTO STAR (May 21, 2015), http://www.thestar.com/business/2015/05/21/parking-apps-will-allow-owners-to-rent-out-parking-spots-by-the-hour.html.
optimal result, they want the result that is best for them. This can lead to sub-
optimal outcomes in a variety of ways.

To start, it is possible that the regulatory entrepreneur may push social
policy away from the optimal outcome. The most direct way this can happen is
when the regulatory entrepreneur’s business is built on reversing an efficient
regulatory regime.\textsuperscript{285} It is plausible that a regulatory entrepreneur who succeeds
in building enough popular support to change the law is likely increasing general
welfare, but this will not always be true. Popular support is a good indicator that
a change in the law is a positive one, but there are several circumstances in which
popular support may give little confidence that a legal change is efficient.

One such scenario is when a law’s chief purpose is to address an externality that falls outside the jurisdiction. For instance, suppose Acmeville is
considering relaxing its restrictions on water pollution, and that the main body of
water affected is a river that flows through many other cities. Assuming that the
proposed change is inefficient, a company based in Acmeville might still be able
to gather substantial local support for it, because the Acmeville voters do not reap
many of the benefits that the current law provides.

A second circumstance in which popular support may be entitled to less
weight is when there is a strong paternalism argument. This can arise when there
is a reason to believe people will fail to adequately look out for their own
interests, such as laws restricting gambling out of concern for the social costs of
gambling addictions and the impact on disadvantaged or vulnerable populations.\textsuperscript{286} It can also arise when people have poor information that prevents
them from understanding what they are getting or giving up by taking a certain
action.\textsuperscript{287}

Regulatory entrepreneurship can also produce inefficiency in smaller
ways; the regulatory entrepreneur may use its power to improve one policy

\textsuperscript{285} For example, assume that cities’ existing taxicab rules were efficient. Uber, by pushing to
change those rules, would be moving society away from the optimal outcome. This is potentially
consistent with Uber having popular support for its efforts: The efficient regime could involve
small losses for many that are dwarfed by corresponding gains for others. Uber may merely have
succeeded in organizing the former.

\textsuperscript{286} See Bruce P. Keller, The Game’s the Same: Why Gambling in Cyberspace Violates Federal
Law, 108 YALE L.J. 1569, 1569 (1999) (“For more than a century, Americans have believed that
the social ills fostered by gambling outweigh its recreational value. As a result, gambling has
been extensively regulated . . . .”); see also Christopher Koopman & Jim Pagels, The Doomed
Crusade Against Daily Fantasy Sites, NATIONAL REVIEW (Nov. 16, 2015, 4:00 AM),
http://www.nationalreview.com/article/427106/doomed-crusade-against-daily-fantasy-sports-
criticalizing the legal developments against fantasy sports
company sites as paternalistic and not serving the interest of consumer protection).

\textsuperscript{287} See, e.g., Thomas Lee Hazen, Filling a Regulatory Gap: It Is Time to Regulate Over-The-
Counter Derivatives, 13 N.C. BANKING INST. 123, 131 (2009) (“One of the longtime premises of
securities regulation is that investors need protection not only against those who would take
advantage of them, but also against themselves.”).
outcome while worsening others. For example, many economists look favorably on Uber’s efforts to increase competition in the taxi industry and to make prices more flexible. At the same time, Uber has often pushed for lower levels of required insurance coverage and less rigorous background checks than regulators favored. It is plausible that Uber’s preferred outcomes on these issues are inefficient, and that the regulators would forge a better rule without Uber’s influence. Similar questions arise with respect to Uber’s attempts to have its drivers treated as independent contractors instead of employees.

Even when regulatory entrepreneurs are fighting to improve inefficient laws, they may produce limited reform measures that meet the company’s goals, but do not address larger social concerns. For example, Tesla’s New Jersey law, considered a huge political victory for Tesla, is quite narrow. It only allows Tesla to operate up to four dealerships in the state. More significantly, it only applies to companies that manufacture zero-emissions vehicles and that were licensed by New Jersey prior to 2014—essentially, only Tesla. In Washington, the bill Tesla secured enables it to open as many dealerships as it likes, but the bill is similarly restricted to companies licensed in the state before 2014, which again means just Tesla. Other innovators—for example, Elio Motors, which has announced plans to produce a car that retails for $6,800 and gets 84 miles per gallon on the highway—would not qualify. Similarly, when Elio has lobbied states for legislation permitting it to make direct sales to consumers, the Elio-enabling bills are sufficiently narrow that they do not apply to Tesla.

These types of grandfathering rules are quite common. For instance, the Air Cargo Deregulation Act enabled the growth of the modern air cargo industry and was heavily instigated by Federal Express. The act gave special positive treatment to existing carriers—essentially, Federal Express and Flying Tiger Line—including a one-year window during which they could enter new markets without competition. But perhaps the best example comes from ResponsibleOhio, which put forward a ballot measure to legalize marijuana in Ohio—but only if it was grown at one of ten predetermined sites, all of which

---

288 See, e.g., Fox, supra note 253.
289 Weise, supra note 24.

294 See Lao et al., supra note 53.
296 Fisch, supra note 182.
297 Id.
were owned by ResponsibleOhio.\footnote{Graham, \textit{supra} note 32.} This would have given ResponsibleOhio a monopoly on legal marijuana sales in the state.\footnote{Id.}

More fundamentally, some people might worry about giving business interests additional political power.\footnote{Many Americans believe that big corporations and other business interests already wield too much political power.  Lydia Saad, \textit{Americans Decry Power of Lobbyists, Corporations, Banks, Feds}, \textit{Gallup} (Apr. 11, 2011), http://www.gallup.com/poll/147026/americans-decry-power-lobbyists-corporations-banks-feds.aspx.} And because much of law involves limiting and managing harms, politically empowering companies that intend to “move fast and break things” could be particularly problematic.\footnote{See supra note 206 and accompanying text.} For instance, Uber has flouted not only taxi regulations, but also campaign finance laws.\footnote{Brad Schmidt, \textit{Uber Fined $2,000 for Violating Portland Lobbying Rules}, \textit{Oregon Live} (Jan. 5, 2016), http://www.oregonlive.com/portland/index.ssf/2016/01/uber_fined_2000_for_violating.html (reporting that the auditor imposed “the maximum fine because she found that Uber showed a pattern of noncompliance, noncooperation and incomplete disclosures” that “undermine[d] the City’s decision-making process and contributed to the erosion of the public’s confidence in the legislative result”).} Uber’s aggressive lobbying tactics have bled into other parts of its operations as well. Uber’s Operation Slog was a concerted effort to recruit drivers from rival Lyft by having paid operatives disguise their identities—they created fake Lyft accounts, linked to burner phones and new credit cards—then hailed rides with Lyft.\footnote{See, e.g., Casey Newton, \textit{This Is Uber’s Playbook for Sabotaging Lyft}, \textit{TheVerge} (Aug. 26, 2014), http://www.theverge.com/2014/8/26/6067663/this-is-ubers-playbook-for-sabotaging-lyft; Alyson Shontell, \textit{OPERATION SLOG: Uber’s Aggressive Plan to Steal Lyft Drivers, Revealed}, \textit{Business Insider} (Aug. 26, 2014), http://www.businessinsider.com/ubers-operation-slog-against-lyft-2014-8.} During those rides, the operatives would solicit their Lyft drivers to switch to Uber.\footnote{Id.} When Lyft started offering service in New York City, Uber falsely told its drivers that New York regulations prohibited drivers from working for both Uber and Lyft.\footnote{Erica Fink, \textit{Uber’s Dirty Tricks Quantified: Rival Counts 5,560 Canceled Rides}, \textit{CNN Money} (Aug. 12, 2014), http://money.cnn.com/2014/08/11/technology/uber-fake-ride-requests-lyft/.} Uber has been dogged by persistent rumors that it had its employees order and then cancel thousands of rides from competing companies.\footnote{Fink, \textit{supra} note 305; Rip Empson, \textit{Black Car Competitor Accuses Uber Of DDoS-Style Attack; Uber Admits Tactics Are “Too Aggressive”}, \textit{TechCrunch} (Jan. 24, 2014), http://techcrunch.com/2014/01/24/black-car-competitor-accuses-uber-of-shady-conduct-ddos-style-attack-uber-expresses-regret/. Uber’s competitors have also faced similar accusations. Ryan Lawler, \textit{Uber Strikes Back, Claiming Lyft Drivers and Employees Canceled Nearly 13,000 Rides}, \textit{TechCrunch} (Aug. 12, 2014), http://techcrunch.com/2014/08/12/uber-lyft-slap-fight/.} Perhaps most troubling, a top Uber executive suggested spending millions of dollars on private investigators to dig up dirt on the personal lives and
families of specific journalists who were critical of Uber. Uber has since disavowed this plan in response to public outrage.

CONCLUSION

Regulatory entrepreneurs abound, and include some of the world’s most valuable companies, both public and private. Although companies such as Uber, Airbnb, DraftKings, Tesla, and Hyperloop are engaged in vastly different areas of business, they are all regulatory entrepreneurs: Each has built a business in an area fraught with legal issues, such as legal gray areas, unfavorable laws, and potential instability. Each of these companies has done so with the plan of remaking the legal landscape into one that supports its business. To do this, regulatory entrepreneurs blend political and economic actions in innovative ways and have changed the balance of power on many political fronts.

Moreover, we believe that companies will continue to engage in regulatory entrepreneurship in the future and perhaps will do so even more frequently. As information technology rapidly advances, it lowers the cost of political engagement. This may allow for a feedback loop in which the greater ease with which citizens can express their preferences creates new opportunities for companies to mobilize large groups of people to push for legal changes on their behalf. Companies’ successes then make investors increasingly comfortable with regulatory entrepreneurship as a business strategy, which expands the already-significant infrastructure (including information technology) that supports regulatory entrepreneurship companies.

This raises the question of how regulatory entrepreneurship will ultimately affect the mix of laws and regulations that society enacts. The most successful regulatory entrepreneurs’ chief source of political power is their army of activated users. Presumably, those members of the public who form the foot soldiers in the regulatory entrepreneur’s political army are furthering their own self-interest by supporting the entrepreneur, and thus stand to gain from policy change along with the entrepreneur. Thus, we are cautiously optimistic that the dynamics we describe could encourage more efficient legislative regimes, particularly at the state and local levels. Regulatory entrepreneurs are profit-seeking entities, however; there is strong reason to believe they will use their political power to pursue their own interests, with little regard to other stakeholders or society.

Accordingly, regulatory entrepreneurship may have significant negative effects. How these positives and negatives weigh out will vary across different companies and circumstances.
